

D* Production in Diffractive Processes

Roger Wolf,
University Heidelberg

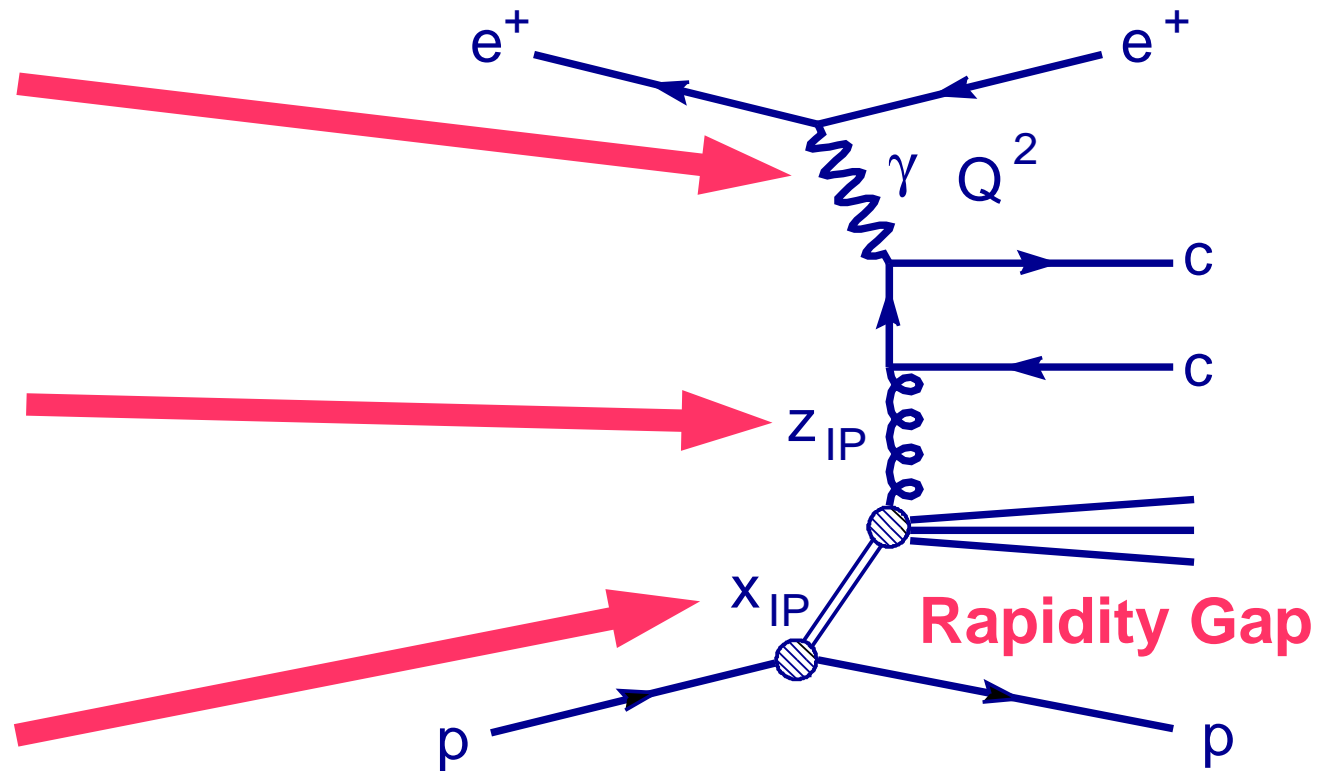

International Europhysics Conference on High Energy Physics 2005 Lisboa

Reminder of variables:

Q^2 : Momentum transfer at the e^- vertex

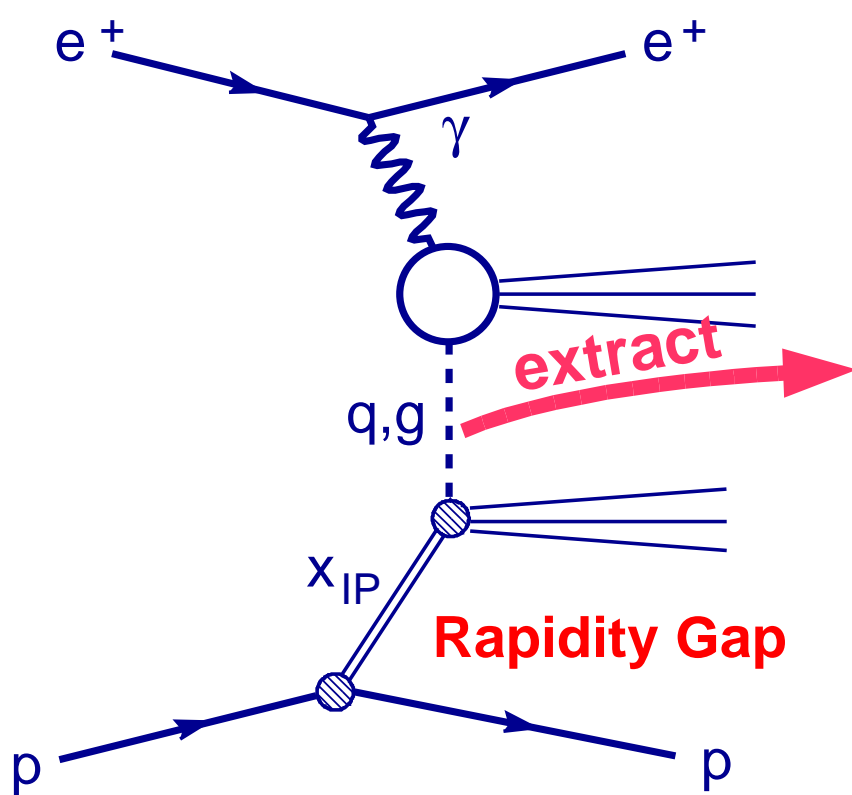

Z_{IP} : Momentum fraction of the color neutral object carried by the gluon

X_{IP} : Momentum fraction of proton carried by color neutral object

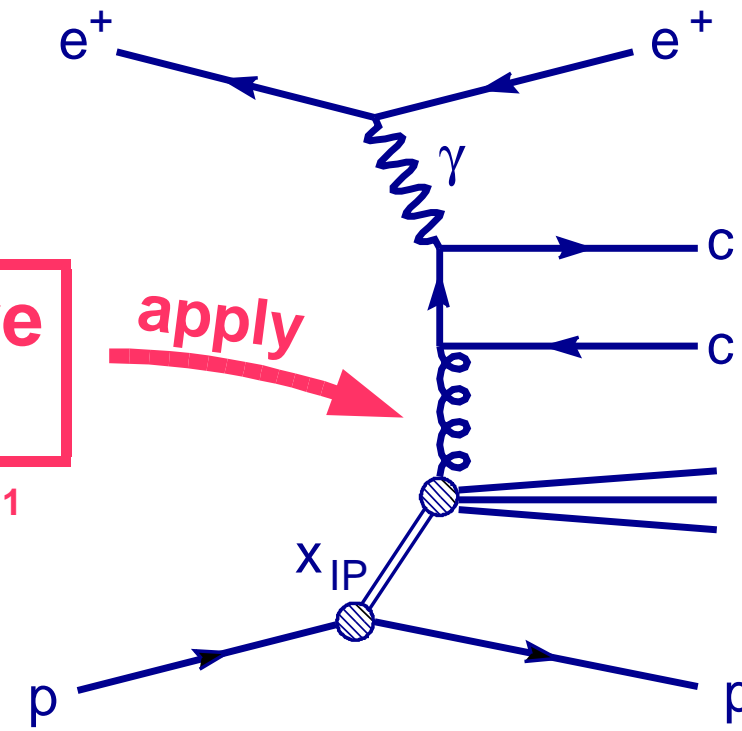

QCD Factorization:

$$\sigma_{\text{measure}} = \text{universal diffractive PDF} \otimes \text{hard ME}$$

Diffractive PDF

- > H1 fit 2002 for H1
- > ACTW (fit B) for ZEUS

Measure diffractive Structure Function from inclusive diffractive scattering

For diffractive Dijets

DIS	γp
... fulfilled	... broken

Datasets:

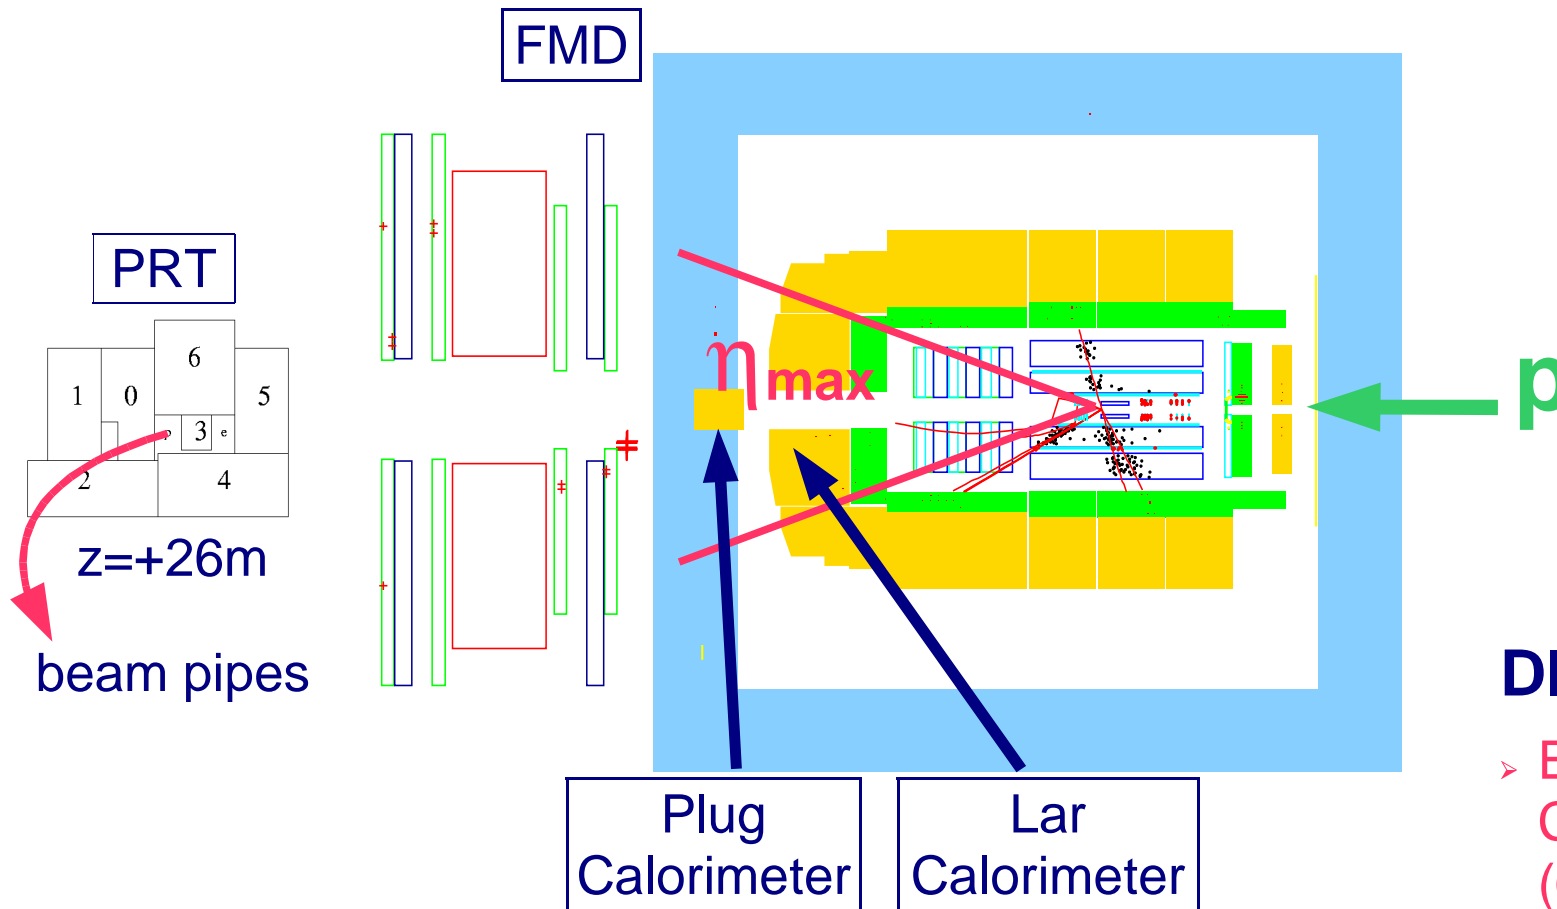

Data Taking Period: HERA I: 98/00

	DIS	γp
H1	42.6 pb⁻¹ $Q^2 \in [2 - 100] \text{ GeV}^2$	
ZEUS	82 pb⁻¹ $Q^2 \in [1.5 - 200] \text{ GeV}^2$	78.6 pb⁻¹ $Q^2 < 1 \text{ GeV}^2$

Diffractive Event Selection in DIS (@ H1):

Diffractive Selection:

- **no activity** in the forward region of the H1 detector above *noise level* ($\eta_{\max} < 3.2$).

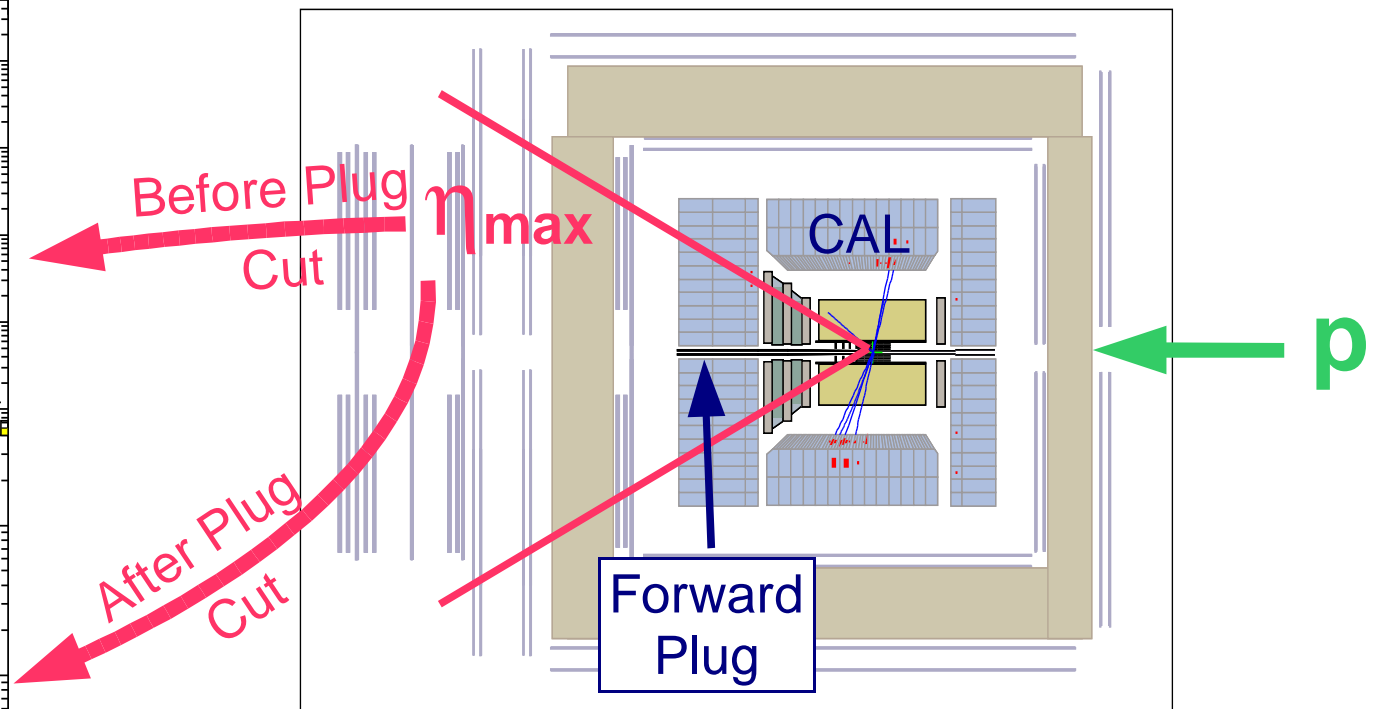

DIS Selection:

- Electron in Spacal Calorimeter ($Q^2 (2, 100) \text{ GeV}^2$).

Diffraction Event Selection in γp (@ ZEUS):

Diffraction Selection:

- **no activity** in the forward region of ZEUS above *noise level* ($\eta_{\max} < 3$ & $E_{\text{FPC}} < 1.5$ GeV).

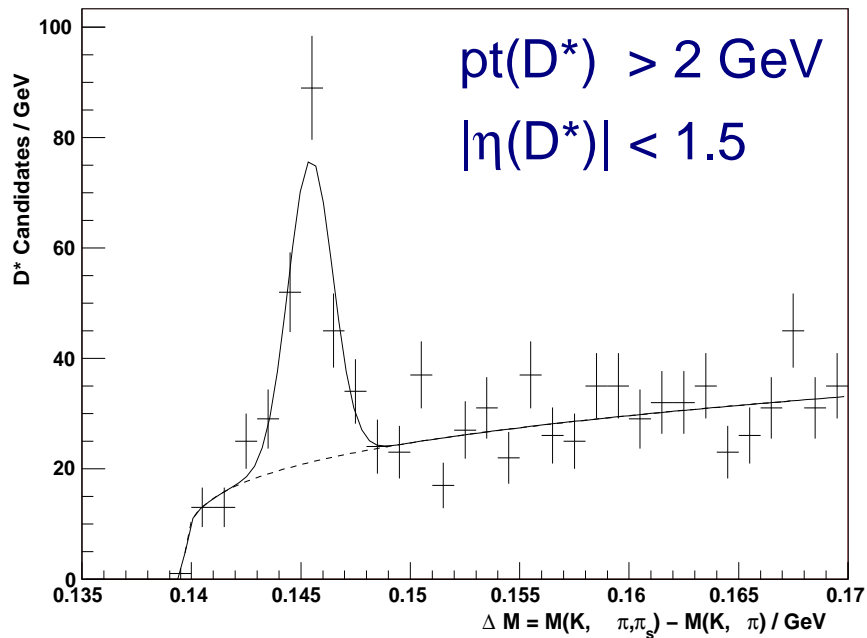

γp Selection:

- No Electron identified in the CAL ($Q^2 < 1 \text{ GeV}^2$).

Charm Selection & Signal Yield

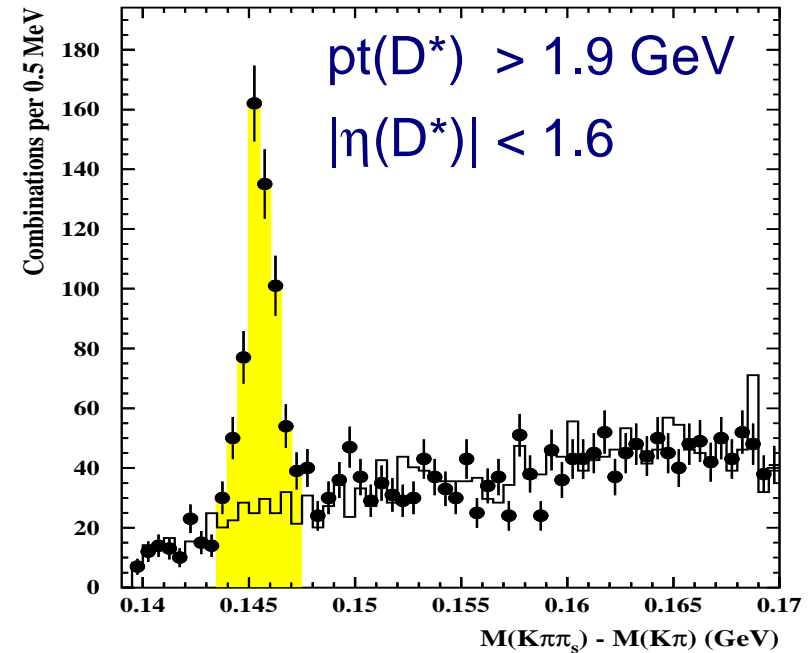

H1: Dis

$$N(D^*) = 140 \pm 16$$

ZEUS: γp

$$N(D^*) = 454 \pm 30$$

Comparison between Experiments in DIS

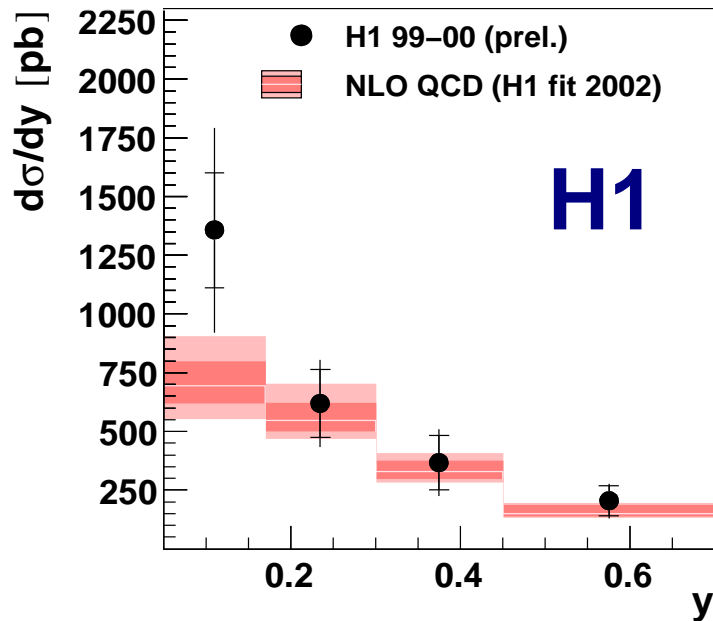

- H1 (Preliminary) Data

- ZEUS Data (extrapolated to H1 phase space)

Good agreement between experiments

Test of QCD Factorization in DIS

NLO QCD Prediction:

- HVQDIS program (massive)
- diff PDF: H1 fit 2002
- Uncertainties: variation of scales (μ_f / μ_r)
variation of m_c
variation of fragmentation function

➔ **Good agreement**

Test of QCD Factorization in DIS

➔ **Good agreement**

Test of QCD Factorization in DIS

NLO QCD Prediction:

- HVQDIS program (massive)
- PDFs: ACTW(fit B) (*diff*)
CTEQ5F3 (*incl*)
- Uncertainties: variation of m_c

$$R_D = \frac{\sigma_{\text{diff}}(x_{\text{IP}} < 0.035, \beta < 0.8)}{\sigma_{\text{incl}}(x < 0.028)}$$

Test of QCD Factorization in DIS

charm contribution to diffractive proton structure:

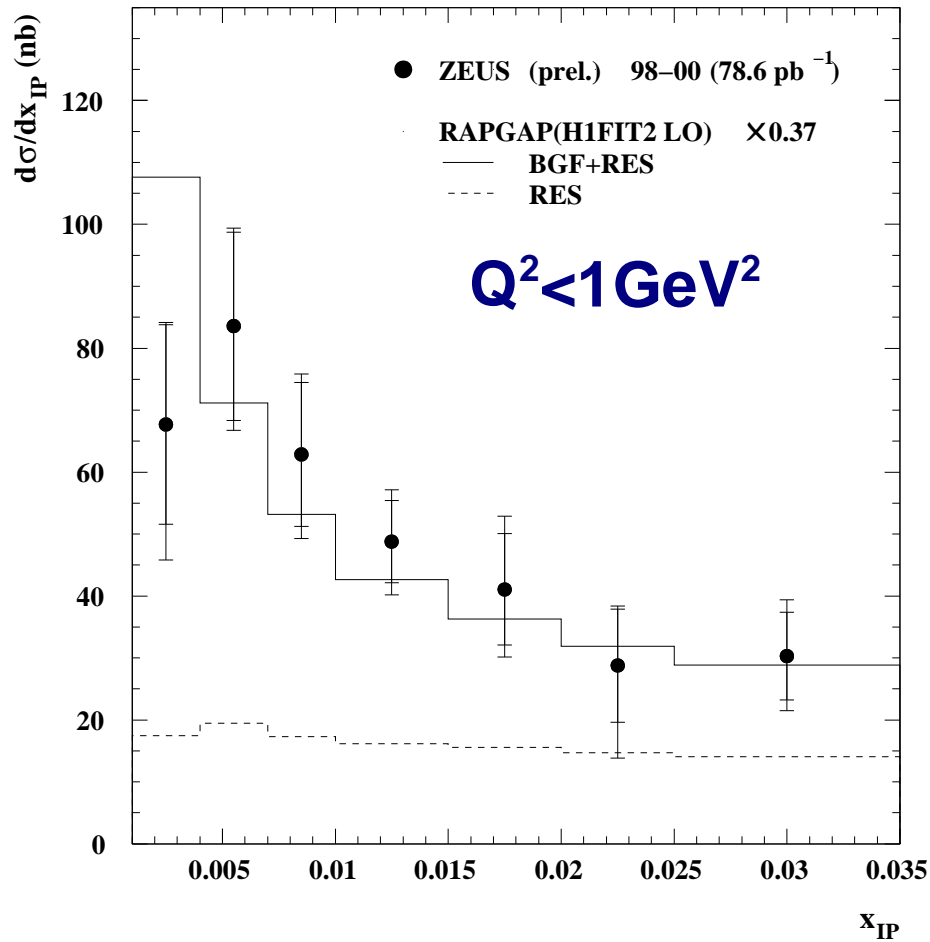

High sensitivity to choice of Structure Function

Measured structure function is well described by NLO

QCD Factorization works for *charm* production in DIS (for both choices of diffractive PDFs)

First Results in γp from ZEUS

LO Monte Carlo:

- Rapgap (with parton showers)
- diff PDF: H1Fit2 (1994) LO
- Three contributions: direct
resolved & excitation

- Factor ~3 in normalization
- shapes ok

First Results in γp from ZEUS

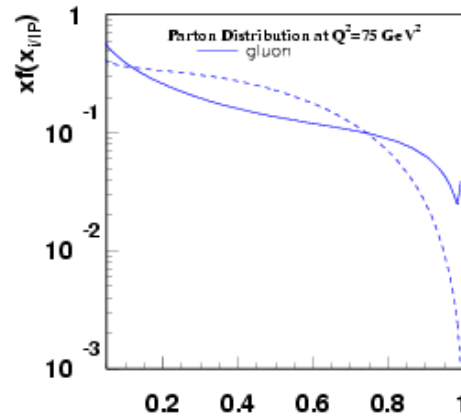

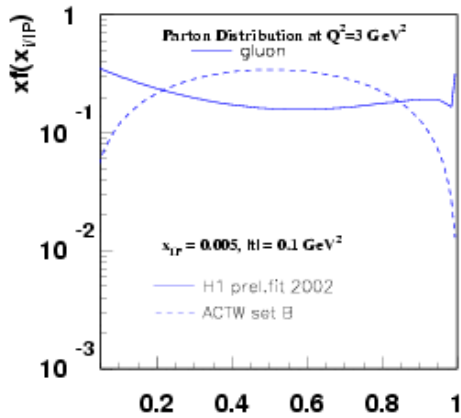

- Factor ~ 3 in normalization
- shapes ok

Need NLO predictions in γp to see if Factorization does or does not hold in NLO

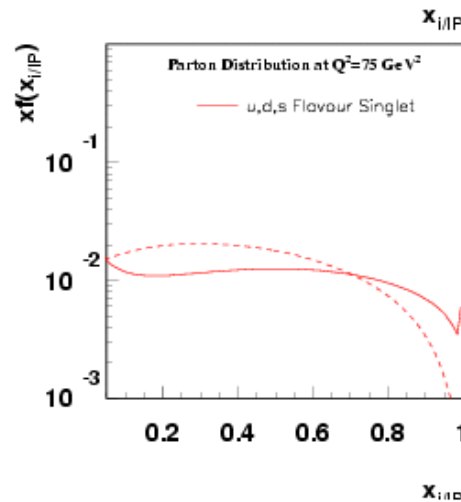

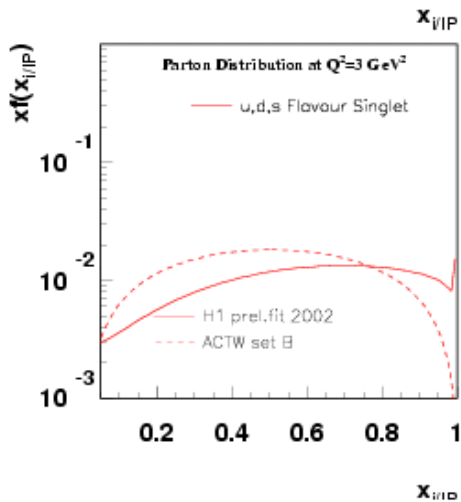

Conclusions

- **Factorization works for *charm* Production in DIS for the chosen diffractive PDFs (H1 fit 2002 & ACTW (fit B))**
- **First Data in γp exist from Zeus**
- **If Factorization holds for γp in NLO will turn out as soon as the NLO predictions in γp are available!**

Backup: H1 fit 2002 versus ACTW (fit B)
