

# Electroweak results from $e^{\pm}p$ collisions at HERA

**Bruno Stella (INFN & Roma 3 University)**

**On behalf of  
the H1 and ZEUS collaborations**

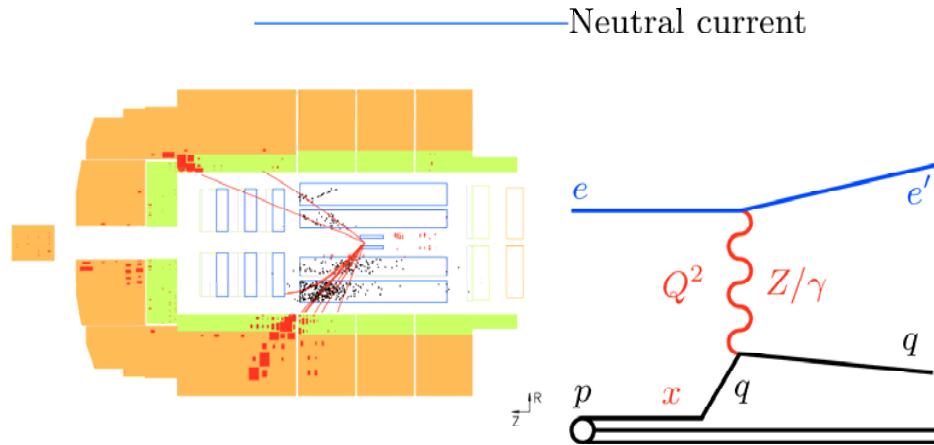

**PHOTON 2007, July 10, Paris**

# Outline:

- HERA I, HERA II collider and the experiments ZEUS and H1
- Inclusive  $e^\pm p$  NC, CC cross sections at high  $Q^2$
- Polarized inclusive  $e^\pm p$  cross sections
- Electroweak studies at EW unification scale
- Combined QCD-EW fits: weak couplings of quarks
- Conclusions and future results.

# Neutral current cross sections

Event topology:

- Scattered electron in the detector

Kinematic variables:

- Momentum transfer squared  $Q^2$
- Fraction of proton momentum  $x$  carried by struck quark
- Inelasticity  $y = \frac{1 - \cos\theta^*}{2} = \frac{Q^2}{sx}$

Cross-section:

$$\frac{d^2\sigma^{NC}}{dx dQ^2} (e^\pm p) = \frac{2\pi\alpha^2}{xQ^4} \left[ Y_+ \tilde{F}_2 \mp Y_- x\tilde{F}_3 - y^2 \tilde{F}_L \right] \quad \text{Helicity functions: } Y_\pm = 1 \pm (1 - y)^2$$

Structure functions:

$$\begin{aligned} \tilde{F}_2^\pm &= F_2 & - (v_e \pm P_e a_e) \kappa \frac{Q^2}{Q^2 + M_Z^2} & F_2^{\gamma Z} & + \dots \\ x\tilde{F}_3^\pm &= & - (a_e \pm P_e v_e) \kappa \frac{Q^2}{Q^2 + M_Z^2} & xF_3^{\gamma Z} & + \dots \end{aligned}$$

$\gamma$  exchange                       $Z\gamma$  interference                       $Z$  exchange

$P_e$ :  $e$  beam polarisation  
 $\kappa^{-1} = \sin^2 2\theta_W$   
 $v, a$ : electroweak couplings

$\tilde{F}_2$  is sensitive to sea and valence quarks:  $F_2 \sim \sum_q (q + \bar{q})$

$x\tilde{F}_3$  is sensitive to valence quarks alone:  $xF_3 \sim \sum_q (q - \bar{q})$

# HERA Running

▶ HERA-I : 1992-2000 unique ep collider

- Unpolarized  $e^+$  and  $e^-$  beams
- 26 GeV  $e^-$  , 820 GeV p

▶ HERA-II : years 2003-Mar/2007

- High luminosity to allow more statistical sensitivity for large  $Q^2$
- 27.6 GeV  $e^-$  , 920 GeV p,  $s^2=320^2\text{GeV}^2$
- Longitudinally polarized  $e^+$  and  $e^-$  beams to allow direct sensitivity to EW effects
- Upgraded detectors

- April-June 2007: a special run with three low proton beam energies (460.-575. GeV) to measure  $F_L$  structure function.

	HERA-I	HERA-II
$e^-$	$\sim 20 \text{ pb}^{-1}$	$\sim 290 \text{ pb}^{-1}$
$e^+$	$\sim 100 \text{ pb}^{-1}$	$\sim 270 \text{ pb}^{-1}$

**1 fb<sup>-1</sup> collected by H1+ZEUS**

# Charged current

Charged current

Event topology:

- Neutrino escapes detection

Kinematic variables:

- Momentum transfer squared  $Q^2$
- Fraction of proton momentum  $x$  carried by struck quark
- Inelasticity  $y = \frac{1 - \cos\theta^*}{2} = \frac{Q^2}{sx}$

$$\frac{d^2\sigma^{CC}}{dx dQ^2} (e^+p) = (1 + P_e) \frac{1}{x} \frac{G_F^2 M_W^4}{4\pi(Q^2 + M_W^2)^2} [(1 - y)^2(xd + xs) + (x\bar{u} + x\bar{c})]$$

$$\frac{d^2\sigma^{CC}}{dx dQ^2} (e^-p) = (1 - P_e) \frac{1}{x} \frac{G_F^2 M_W^4}{4\pi(Q^2 + M_W^2)^2} [(xu + xc) + (1 - y^2)(x\bar{d} + x\bar{s})]$$

Polarisation

$W$  exchange

Parton densities

# Measurement of NC & CC cross sections

HERA II

for electron & positron scattering

Unpolarised cross sections

Cross sections measured over 6 orders of magnitude

NC cross section dominated by photon exchange

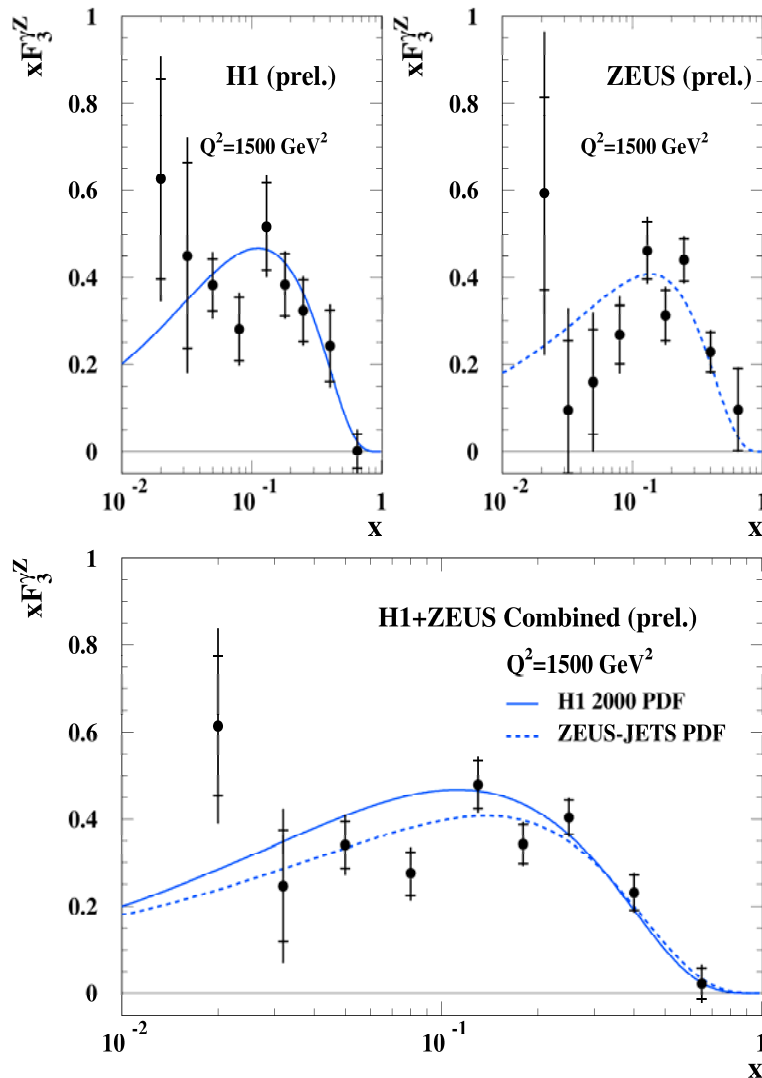

NC  $e^+/e^-$  difference due to  $Z^0$  exchange

CC cross section similar to NC cross section at high  $Q^2 \rightarrow$  EW unification

Remaining difference due to PDFs

# Extraction of $x F_3^{\gamma Z}$ by $\sigma_{NC}(e^-) - \sigma_{NC}(e^+)$

HERA

$x F_3^{\gamma Z}$ :  $\tilde{F}_3$  with kinematical factors removed

$$x F_3^{\gamma Z} = \sum_q 2e_q a_q (xq - x\bar{q}) = \frac{2}{3} x u_v + \frac{1}{3} x d_v$$

→ Valence quark content of  $p$

→ Sensitivity to  $a_q$

Weak  $Q^2$  dependence → transform all points to  $Q^2 = 1500 \text{ GeV}^2$

Sum rule:

$$\int_0^1 \frac{x F_3^{\gamma Z}}{x} dx = \int_0^1 \left( \frac{2}{3} u_v + \frac{1}{3} d_v \right) dx = \frac{5}{3}$$

Combined result from ZEUS, H1:

$$\int_{0.02}^{0.65} \frac{x F_3^{\gamma Z}}{x} dx = 1.21 \pm 0.09 \text{ (stat)} \pm 0.08 \text{ (sys)}$$

Compatible with Sum rule if integral is extrapolated to  $[0, 1]$

## DIS at EW scale with polarization

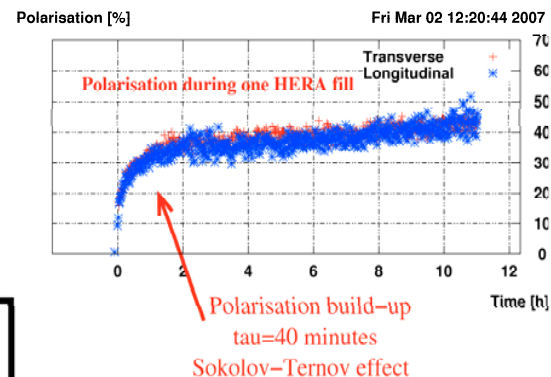

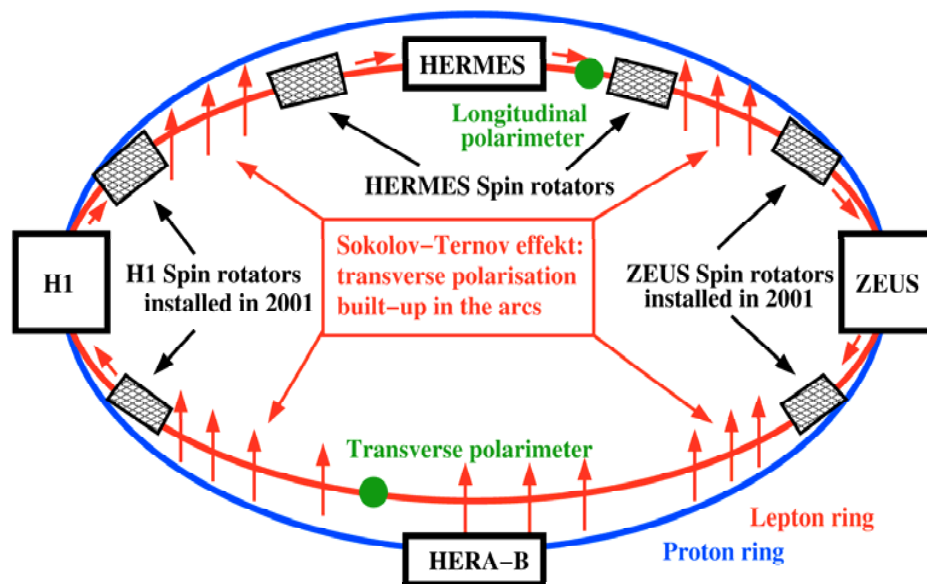

First polarized DIS at EW scale

-- Right-handed CC ?

-- Parity violation in weak NC

# Lepton polarisation at HERA II

Polarisation is changing during the fill  
 Monitored by two independent Compton polarimeters

$P_e = 30 \dots 45\%$  achieved regularly

HERA I+II:

Transverse polarisation for H1+ZEUS

Not useful for physics

HERA II:

Luminosity upgrade for H1+ZEUS

Longitudinal polarisation for H1+ZEUS

→ new electroweak results

# W<sub>R</sub> mass limit

HERA-II  
Data

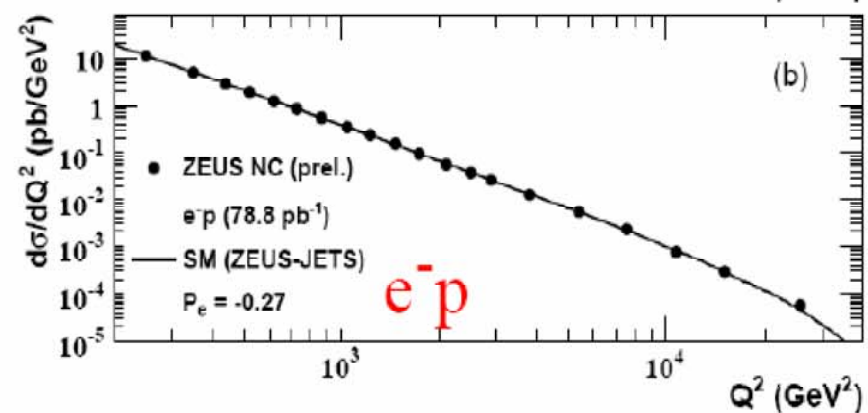

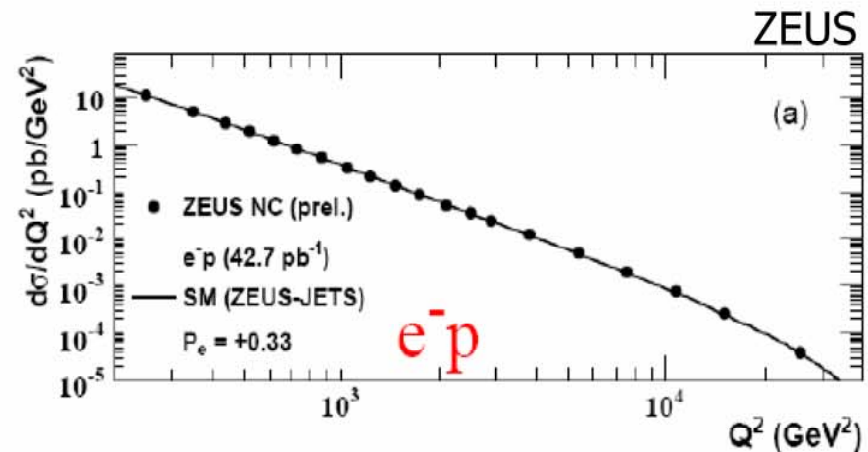

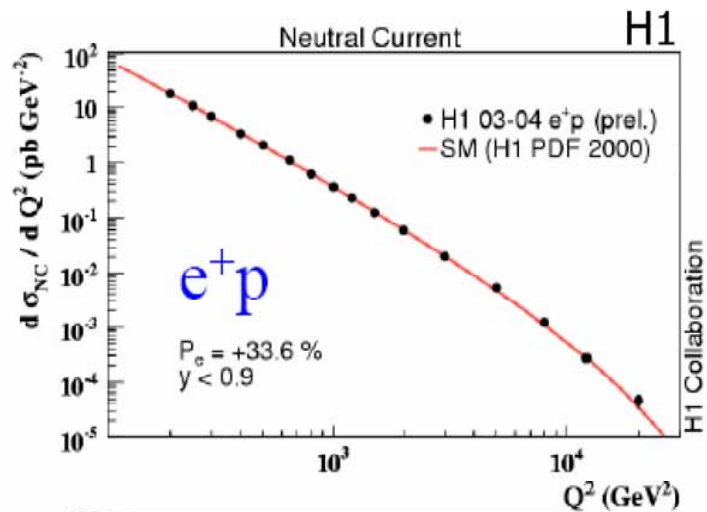

► Assuming  $g_L = g_R$  and  $\nu_R$  is light:

$M(W_R) > 208 \text{ GeV}$  (from H1 e<sup>+</sup> data)  
(Error dominated by polarization uncertainty)

H1 e<sup>-</sup>: 186 GeV  
ZEUS e<sup>-</sup>: 180 GeV

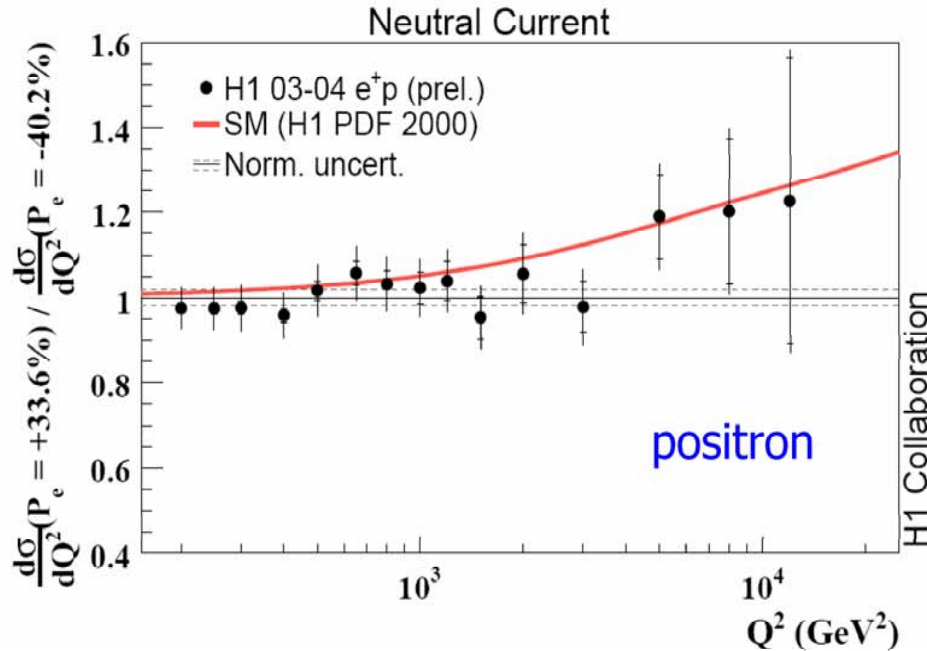

- $\beta^+$  decay:  $> 310 \text{ GeV}$  (polarized <sup>12</sup>N decay)
- cf. W' :  $> 786 \text{ GeV}$  by CDF (W' → eν, μν)

# Polarized $e^+, e^-$ NC cross sections

Both experiments measured positron/electron, left/right cross sections

# NC R/L polarization ratio

Measure ratio of NC cross section

$$\frac{d\sigma}{dQ^2} \quad R/L$$

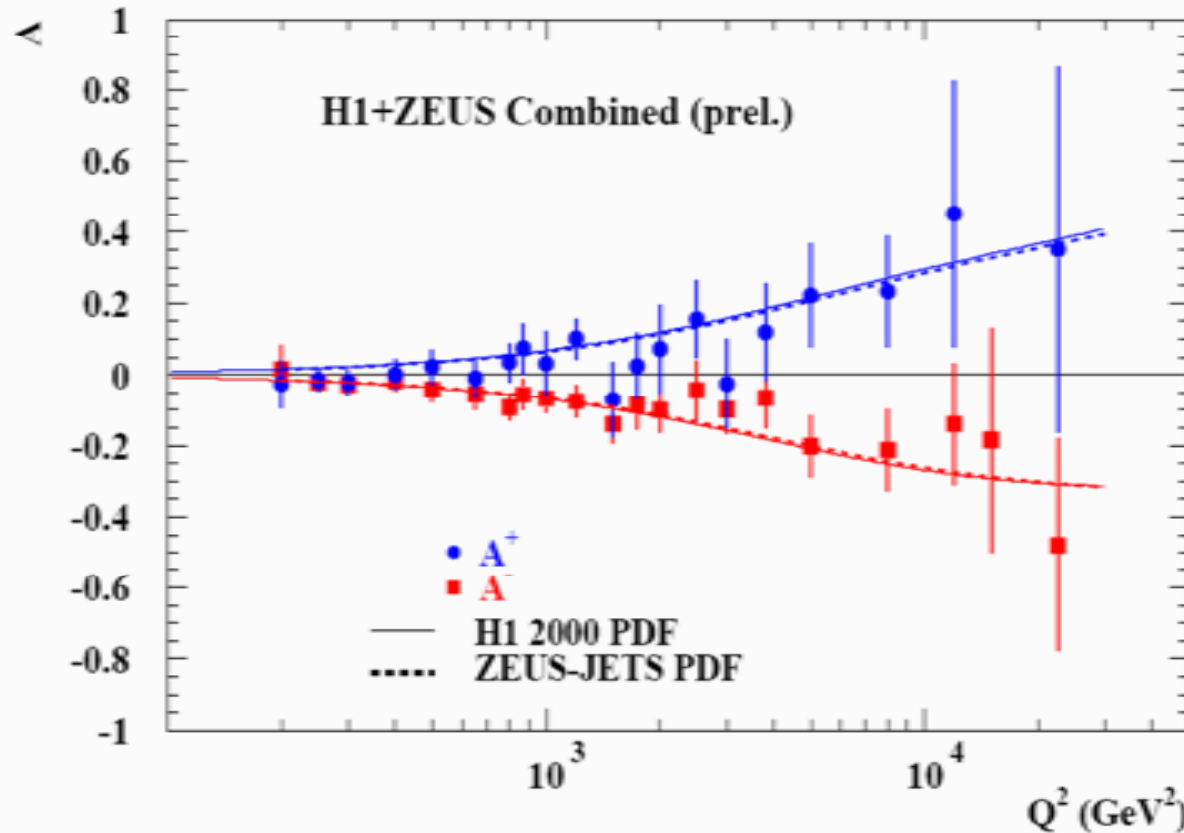

Effect increases with  $Q^2$   
As do the statistical uncertainties!

Data consistent with SM

suppression of electron R  
enhancement of positron R

# NC polarization asymmetry

$$A^\pm = \frac{2}{P_R - P_L} \cdot \frac{\sigma^\pm(P_R) - \sigma^\pm(P_L)}{\sigma^\pm(P_R) + \sigma^\pm(P_L)} \approx \chi_Z a_e \frac{F_2^{\gamma Z}}{F_2} \quad \text{Direct measure of parity violation}$$

define the difference of positron and electron polarisation asymmetries

$$\delta A = A^+ - A^-$$

$\chi^2$  of  $\delta A$  being different from zero = 4.0 ( $3.1 \times 10^{-3}$  probability)

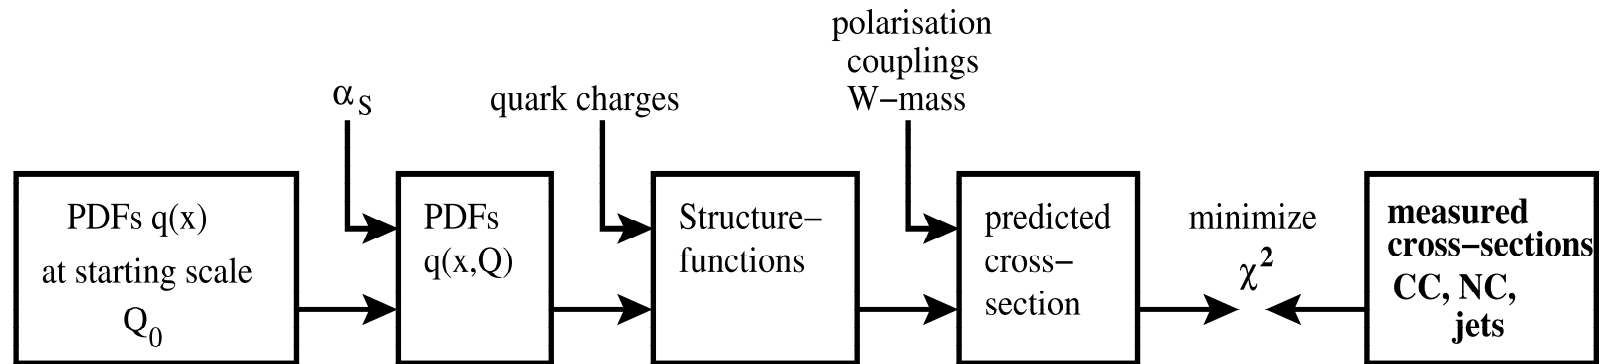

## QCD + EW combined analysis

- $M_W$
- Light quark couplings to Z

## Electroweak fits at HERA

Charged current: sensitivity to  $G_F, M_W$

Neutral current: sensitivity to light quark axial and vector couplings  $v_{u,d}, a_{u,d}$

HERA fits: mainly about precise determination of  $\alpha_S$  and PDFs

Results presented here: recent papers about HERA fits of electroweak parameters.

# $M_W$ in the framework of SM

- In the SM  $G_F$  and  $M_W$  are related  $\rightarrow$  Fits fully assuming SM

-- On-Mass-Shell (OMS) scheme

$$\frac{d^2\sigma}{dx dQ^2} = \frac{\pi\alpha^2}{4M_w^2 \left(1 - \frac{M_w^2}{M_Z^2}\right)^2} \frac{1}{(1 - \Delta r)^2} \left(\frac{M_w^2}{Q^2 + M_w^2}\right)^2 \Phi(pdfs)$$

Quadratic dependence on  $m_t$     Logarithmic dependence on  $M_H$

$M_W$  (GeV)

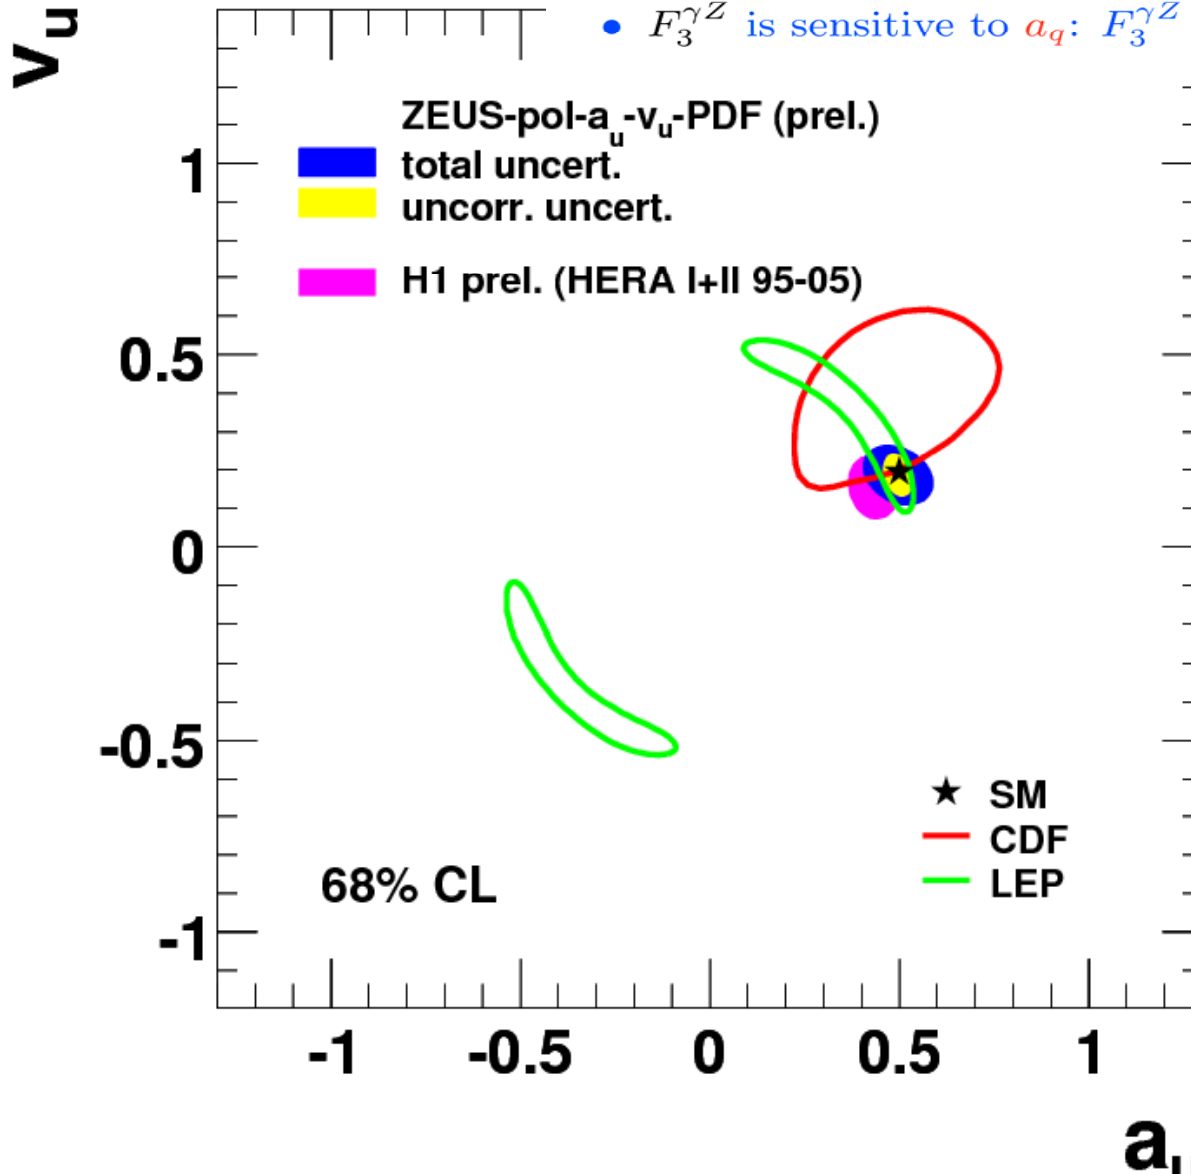

- ▶ A fit to  $M_W$  with  $M_Z$  fixed
  - $M_W = 80.786 \pm 0.205(\text{exp}) \text{ GeV}$
- ▶ A fit to  $m_t$  with  $M_Z, M_W$  fixed
  - $m_t = 104 \pm 44(\text{exp}) \text{ GeV}$
  - Determination of  $m_{\text{Top}}$  in DIS (via loop corr)

# Electroweak u and d coupling to Z0

NC cross-section: measure  $u$ ,  $d$  quark axial and vector couplings:

- $F_2^{\gamma Z}$  is sensitive to  $v_q$ :  $F_2^{\gamma Z} = 2 \sum_q e_q v_q (xq + x\bar{q})$
- $F_3^{\gamma Z}$  is sensitive to  $a_q$ :  $F_3^{\gamma Z} = 2 \sum_q e_q a_q (xq + x\bar{q})$

Half constrained fit:  $v_d, a_d$  couplings fixed at SM val.

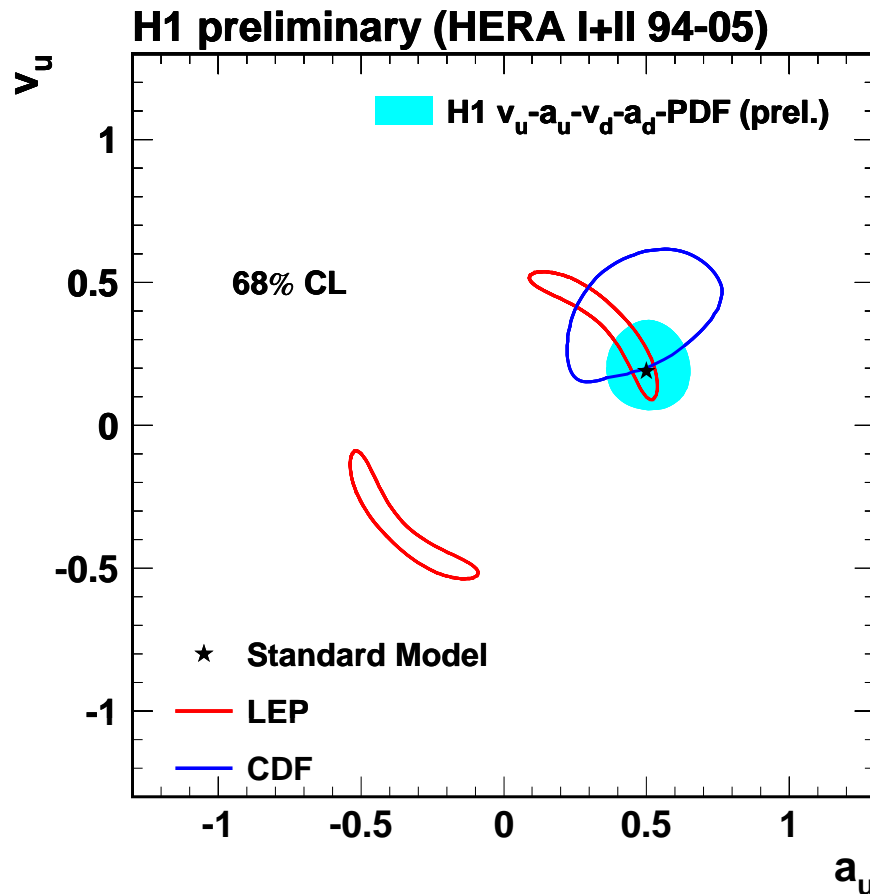

# Constrained fit to **d** quark couplings

Half constrained fit:  $v_u, a_u$   
couplings fixed at SM values.

# Un-(minimum) constrained fit

► All four ( $V_u, A_u, V_d, A_d$ ) free fit

► A EW+QCD fit to determine:  $T_u^3$ ,  $T_d^3$ ,  $\sin^2\theta_W$

In the SM

$$v_f = T_f^3 - 2e_f \sin^2 \theta_W$$

$$a_f = T_f^3$$

$$T_u^3 = 0.47 \pm 0.05 \pm 0.13$$

$$T_d^3 = -0.55 \pm 0.18 \pm 0.35$$

$$\sin^2 \theta_w = 0.231 \pm 0.024 \pm 0.070$$

Nb: In this fit,  $\sin^2 \theta_w$  also contributes to the propagator term

# Electroweak results from $e^\pm p$ collisions at HERA Summary

- HERA is now able to investigate elementary interactions with high luminosity and longitudinal polarization:
  - NC & CC measured at **EW unification** scale with  $e^+$  and  $e^-$ .
  - **First polarized** DIS at EW scale.
  - V-A structure of CC tested at high energy.
  - First measurement of parity violation in weak NC at EW scale.
  - Simultaneous QCD & EW fits made;
  - **Best** determination of light quarks **a,v** couplings to  $Z^0$ .
- HERA till now confirms the glory of the **SM**.

## Future

- HERA ended its high energy run on 21/Mar/2007: **1 fb<sup>-1</sup>** by H1 and ZEUS
  - **~Half analyzed**. HERA legacy in EW sector will come soon.
  - Low energy run has followed to determine  $F_L$ .
  - **HERA switched off** June 30 2007 at 23:26. *Many years of analysis.*-

# Backup slides

# Colliders at EW scale

LEP:  
 $m_Z, \Gamma_Z, \sigma_h^0, R_l^0, A_{FB}^{0,l}$   
 $P_\tau \rightarrow A_l$   
 $Q_{FB} \rightarrow \sin^2 \theta_{eff}^{lept}$

SLD:  $A_l$   
 LEP+SLD:  
 $R_b^0, R_c^0, A_{FB}^{0,b}, A_{FB}^{0,c}, A_b, A_c$

(ref. R.Claire @ SubZ WS)

## ► HERA

● Probe proton structure by t-channel exchange of gauge bosons

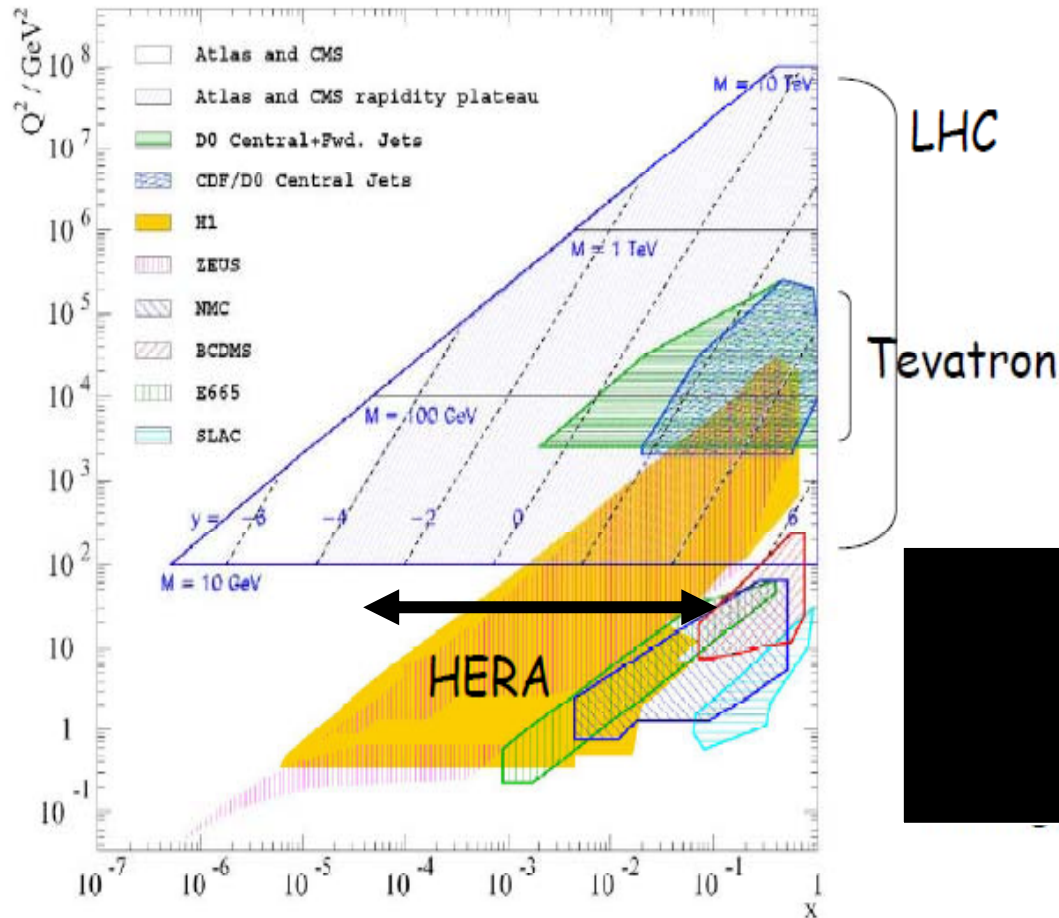

- At low  $Q^2$ : mainly by  $\gamma$

-- At high  $Q^2$ :  $\gamma/Z$  (NC) and  $W$  (CC)  $\sigma(ep) \propto \sum_{EW} \sigma(eq) \otimes (pdf) \otimes QCD$

● Investigate electron-quark elementary processes based on knowledge of proton structure (at lower  $Q^2$  + DGLAP evolution)

- Search for new symmetries and particles.
- Use own proton Parton Density Functions (PDF)

# High $Q^2$ at HERA and LHC

High  $Q^2$  region :  
 -- DGLAP evolution of proton structure.  
 -- Based on these knowledge, study elementary processes (EW) at large energy scale

Low  $Q^2$  region :  
 -- Precise measurement of proton structure

**(Remind: gluons/sea at  $x=10^{-4} \sim 10^{-2}$  are determined by HERA)**

# Quark radius

► Probing proton with highest spatial resolution

— Quark radius : if there is structure in the quark, DIS cross section at high  $Q^2$  will be modified due to spatial distribution of quark charge :

$$\frac{d\sigma}{dQ^2} = \frac{d\sigma^{SM}}{dQ^2} \left(1 - \frac{R_q^2}{6} Q^2\right)^2$$

(like “form factor” with  $R_q$  corresponding to the average radius of quark charge)

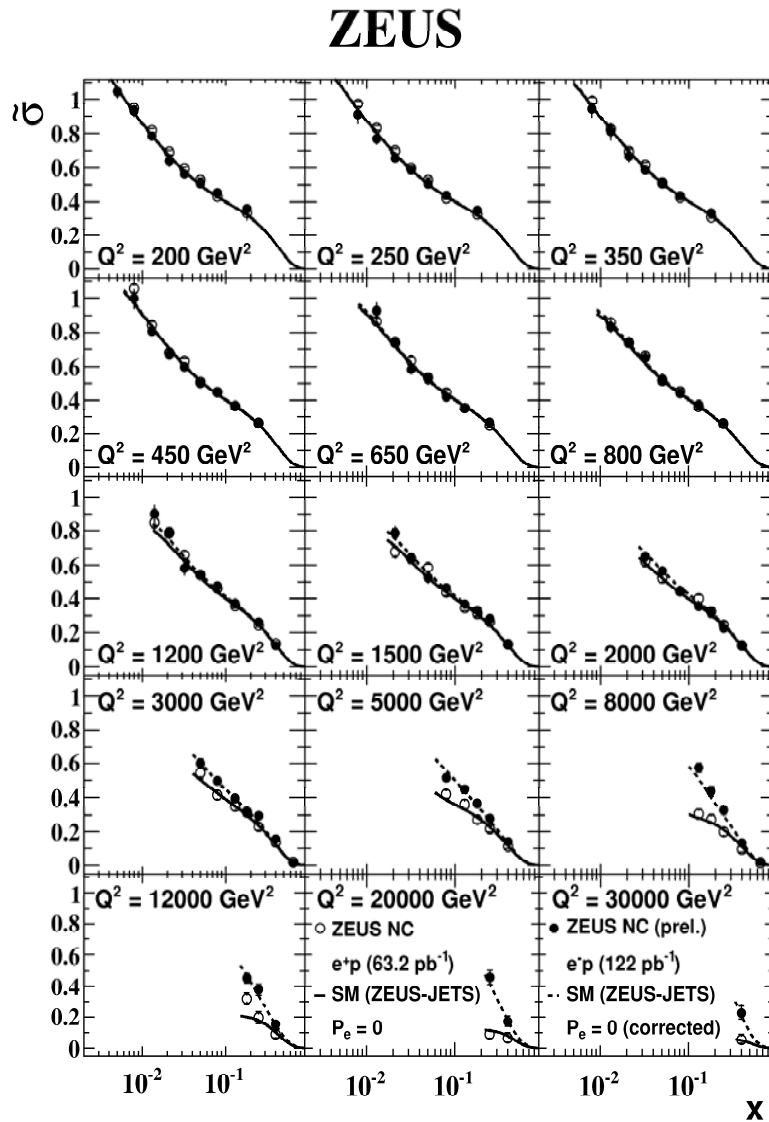

# EW+QCD fit

- A fit to single experimental data
  - H1 fit to H1 data only, ZEUS fit to ZEUS data only
  - Advantage: Handling of systematic errors is straightforward
  - Free from target-mass correction in fixed-target data
- A fit to determine both PDF and EW parameters
  - Advantage: correlation automatically taken into account

# Double-differential NC cross-section, $xF_3$

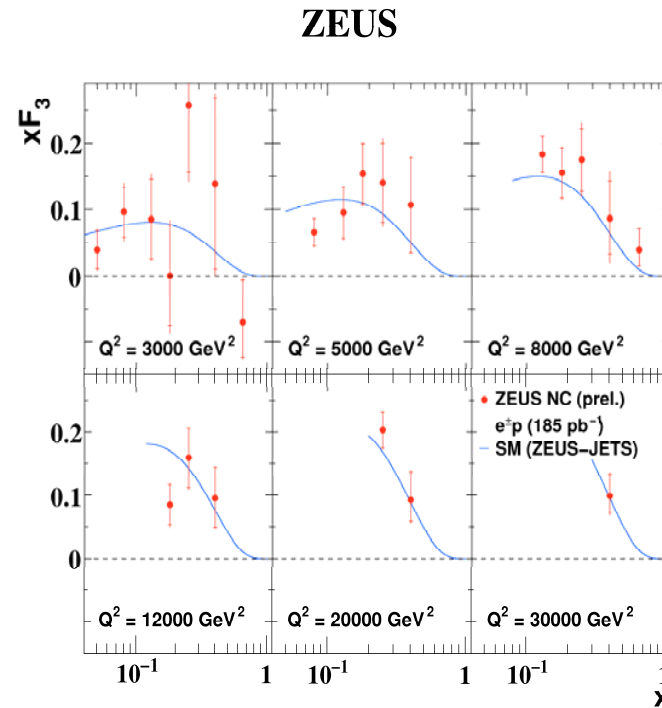

Reduced cross-section

$$\tilde{\sigma}^\pm = Y_+ \tilde{F}_2 \mp Y_- x\tilde{F}_3 - y^2 \tilde{F}_L$$

Plot: ZEUS high  $Q^2$  data for HERA I ( $e^+p$ ) and HERA II ( $e^-p$ )

Difference between  $e^+$  and  $e^-$ : electroweak effects

→ extract structure function  $x\tilde{F}_3$

# EW with polarized lepton beams

- Polarization = Asymmetry of Helicity states:  
 $P = (N_R - N_L) / (N_R + N_L)$
- Helicity = Chirality (if mass is neglected)  
 → By means of Pol, chiral structure can be tested.

## ► Charged-current DIS

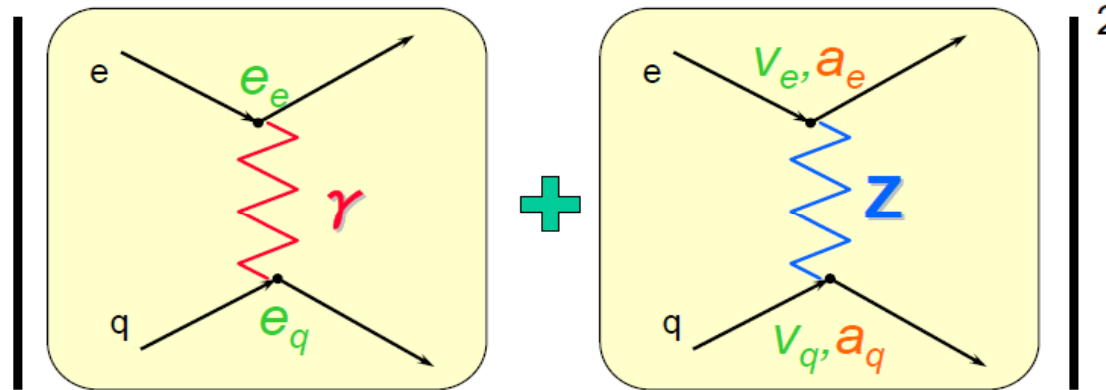

- “Pure” Weak  
 → Chiral structure of weak int. is directly visible as a function of Polarization
- Weak = “100% parity violated” (no RH)  
 → Zero cross section @ Pol=1 (-1 for e<sup>+</sup>)  
 →  $\sigma(\text{Pol}) = (1 \pm \text{Pol}) \sigma(\text{Unpol})$

## ► Neutral-current DIS

- Weak’s parity violating effect through  $\gamma$ -Z interference and pure Z  
 → visible only at large  $Q^2$
- Such  $\gamma$ -Z and Z terms contain EW parameters,  
 i.e. quark couplings to Z,  $\sin\theta_w, M_Z$

# Light quark couplings to Z

$$\frac{d^2\sigma_{e^+p}}{dx dQ^2} = \frac{2\pi\alpha^2}{xQ^4} \left[ \{1 + (1-y)^2\} F_2 \mp \{1 - (1-y)^2\} xF_3 \right]$$

$$\begin{aligned} \tilde{F}_2 &= F_2^\gamma - (v_e \pm P_e a_e) \chi_Z F_2^{\gamma Z} + ((v_e^2 + a_e^2) \pm P_e 2v_e a_e) \chi_Z^2 F_2^Z \\ \tilde{F}_3 &= - (a_e \pm P_e v_e) \chi_Z F_3^{\gamma Z} + ((2v_e a_e \pm P_e (v_e^2 + a_e^2)) \chi_Z^2 F_3^Z \end{aligned}$$

Unpol:  $\sigma(e^+) - \sigma(e^-) \rightarrow F_3^{\gamma Z}$   
 Pol :  $\sigma(P_e \rightarrow) - \sigma(P_e \leftarrow) \rightarrow F_2^{\gamma Z}$   
 $\downarrow$   
 Unpol:  $\sigma(e^+) - \sigma(e^-) \rightarrow a_f$   
 Pol :  $\sigma(P_e \rightarrow) - \sigma(P_e \leftarrow) \rightarrow v_f$

## ● EW structure functions in QPM

$$\begin{aligned} F_2^{\gamma Z} &= 2e_f v_f \Sigma_i x [q_f + \bar{q}_f] \\ F_2^Z &= (v_f^2 + a_f^2) \Sigma_i x [q_f + \bar{q}_f] \\ F_3^{\gamma Z} &= 2e_f a_f \Sigma_i x [q_f - \bar{q}_f] \\ F_3^Z &= 2v_f a_f \Sigma_i x [q_f - \bar{q}_f] \end{aligned}$$
