k'

Electron (e^\pm)
Neutrino

$$Q^2 = -(k - k')^2$$

γ, Z^0
 W^\pm

P'_q

$$P_q = xP$$

X

F_2

The Structure Function F_2

Unpolarized $e^\pm p$ NC cross section:

$$\frac{d^2\sigma}{dxdQ^2} = \frac{2\pi\alpha^2}{xQ^4} [Y_+ F_2 \mp Y_- xF_3 - y^2 F_L]$$

with $Y_\pm = 1 \pm (1 - y)^2$

$F_2 \propto \sum (q + \bar{q})$: dominates cross section

$xF_3 \propto \sum (q - \bar{q})$: contributes at high Q^2

$F_L \propto \alpha_s g(x, Q^2)$: contributes only at high y

Four-momentum transfer:

$$Q^2 = -(k - k')^2$$

Bjorken-x:

$$x = \frac{Q^2}{2pq}$$

Inelasticity:

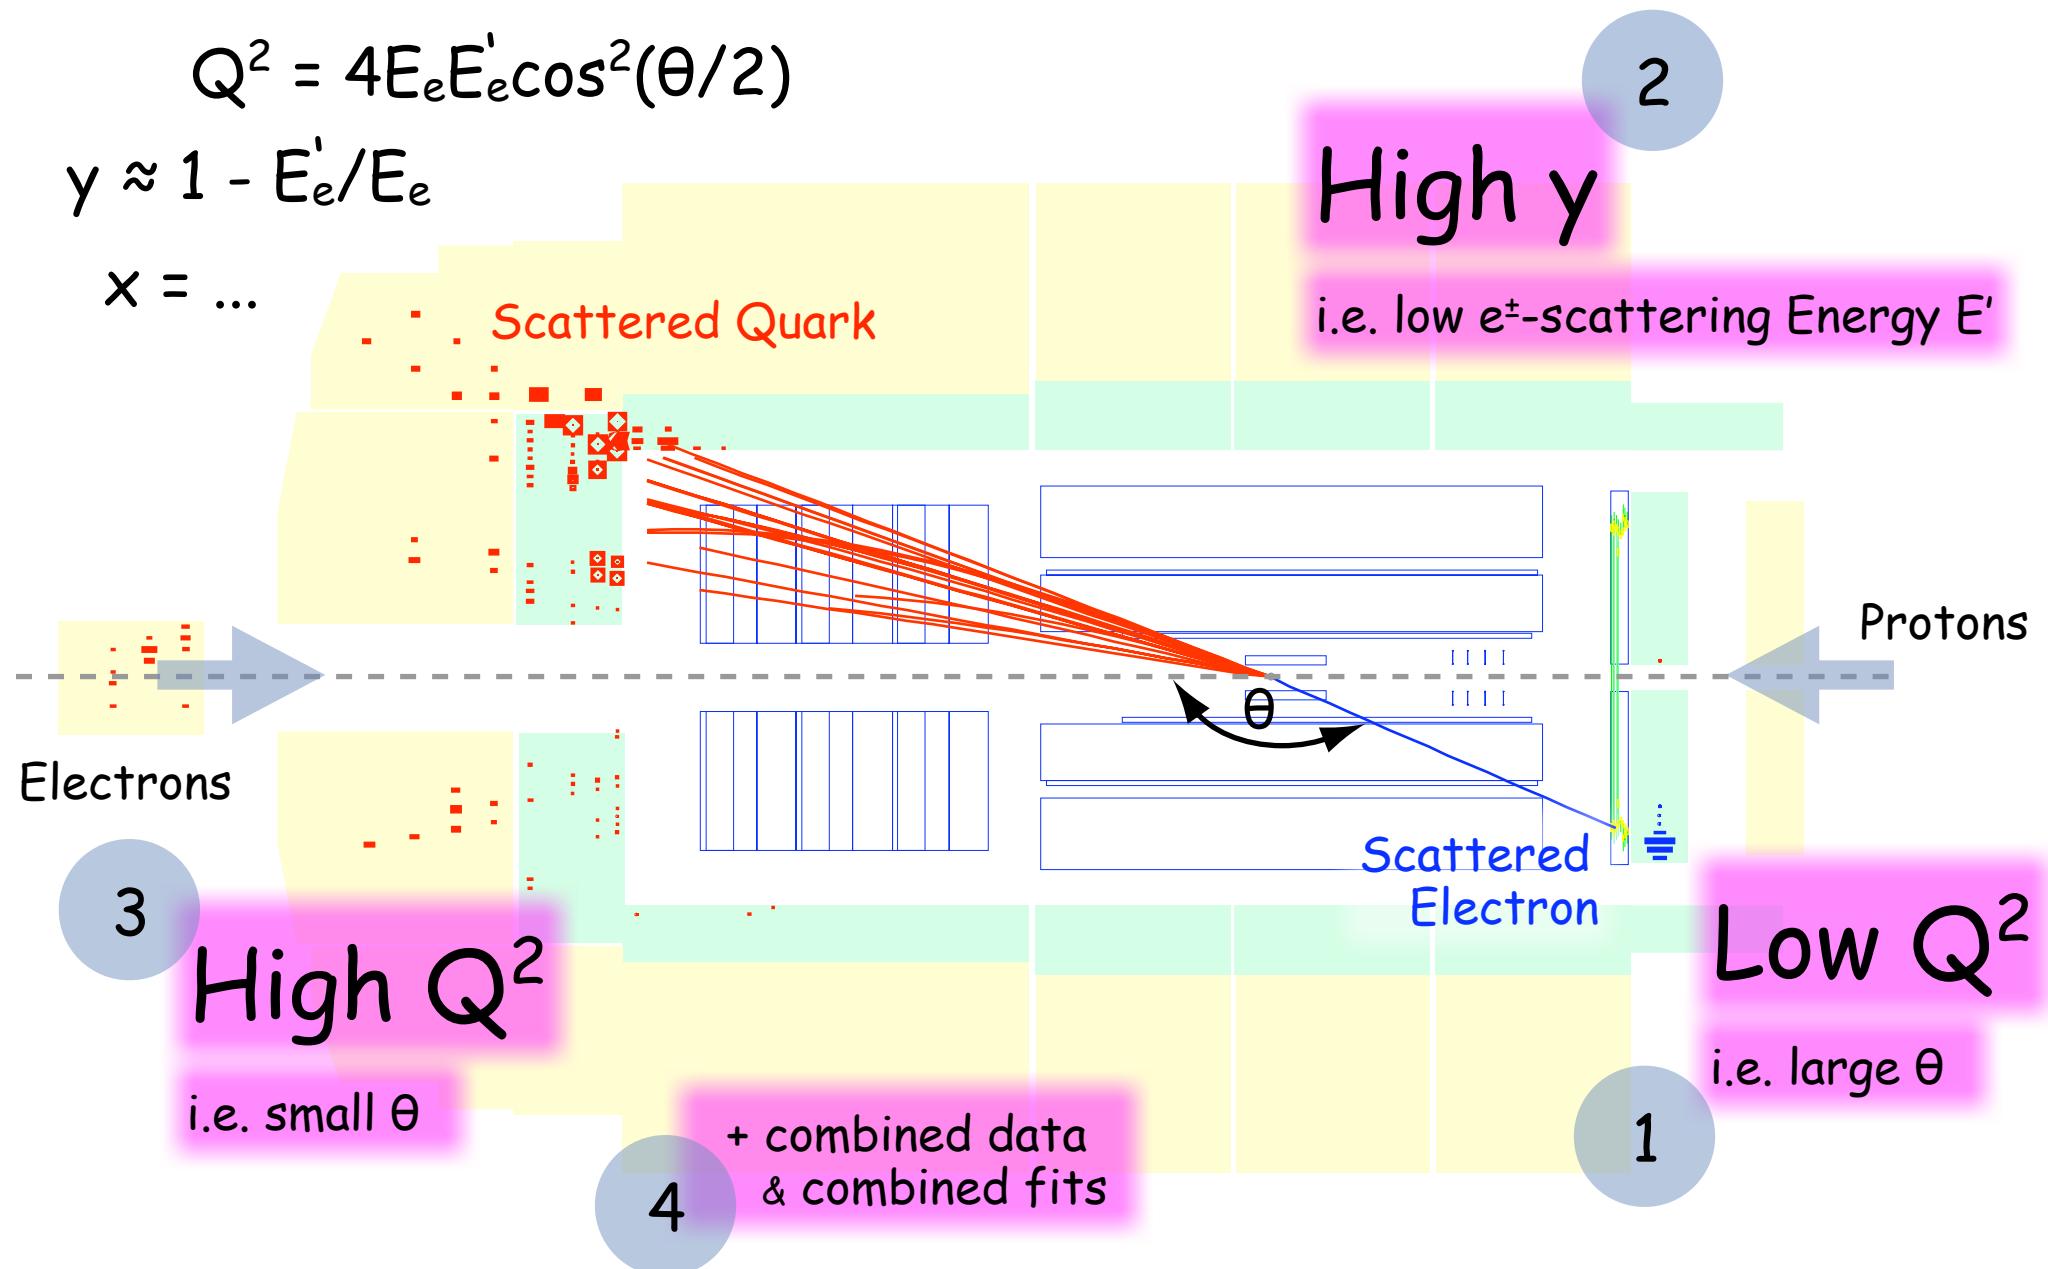

$$y = \frac{pq}{pk} = \frac{Q^2}{sx}$$

A DIS-Event in the Detector

$$Q^2 = 4E_e E'_e \cos^2(\theta/2)$$

$$y \approx 1 - E'_e/E_e$$

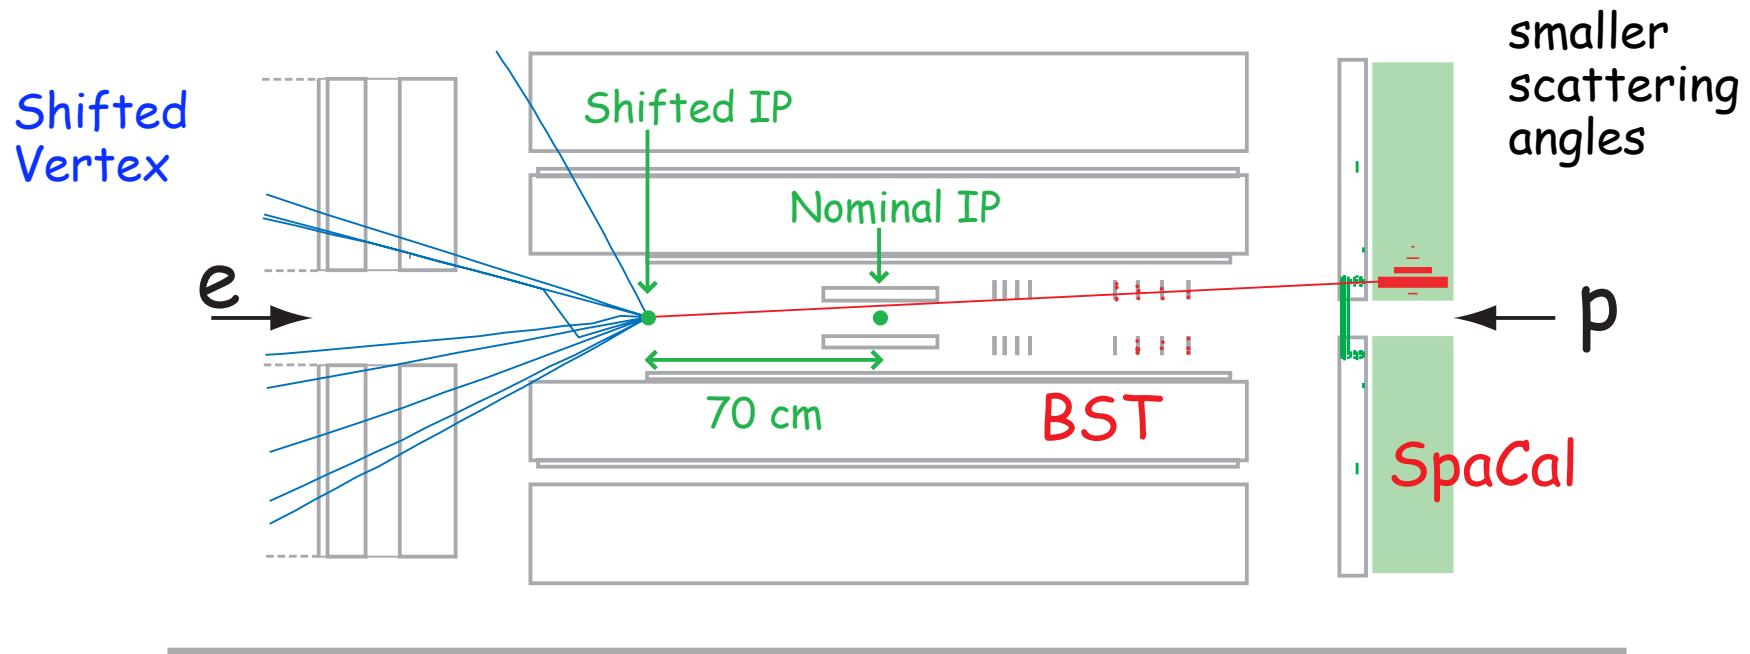

$$x = \dots$$

Low Q^2

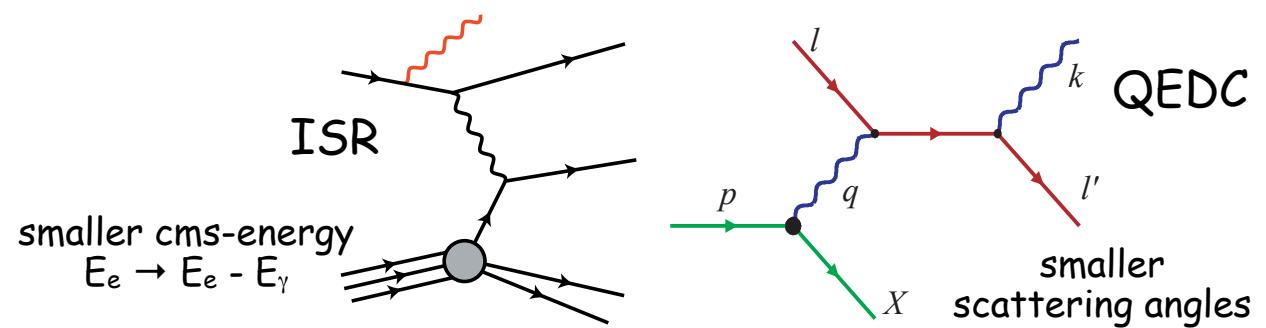

Special Experimental Techniques

- H1: shifted vertex collisions, initial state radiation (un-tagged ISR)
- ZEUS: low angle calorimeter & tracker (BPT), tagger ISR

... also:

Radiative events
Low angle detectors

Recent Low Q^2 Results

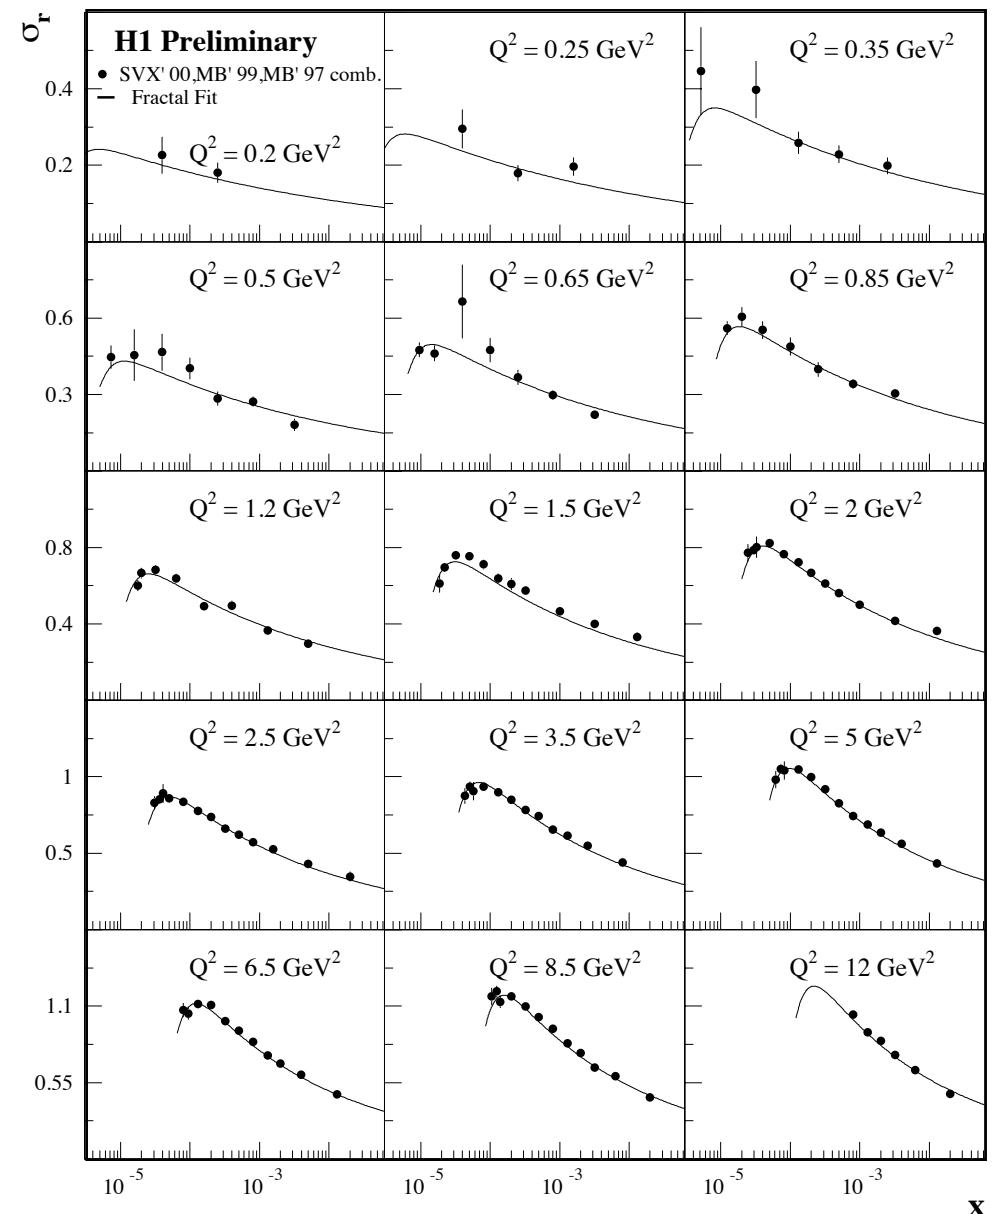

H1 Data:

Min Bias '97 [publ.]

Min Bias '99 [high γ]

Shifted Vtx '00 [low Q^2]

Combined
Precision: up to 1.5%
[for $Q^2 > 5 \text{ GeV}^2$]

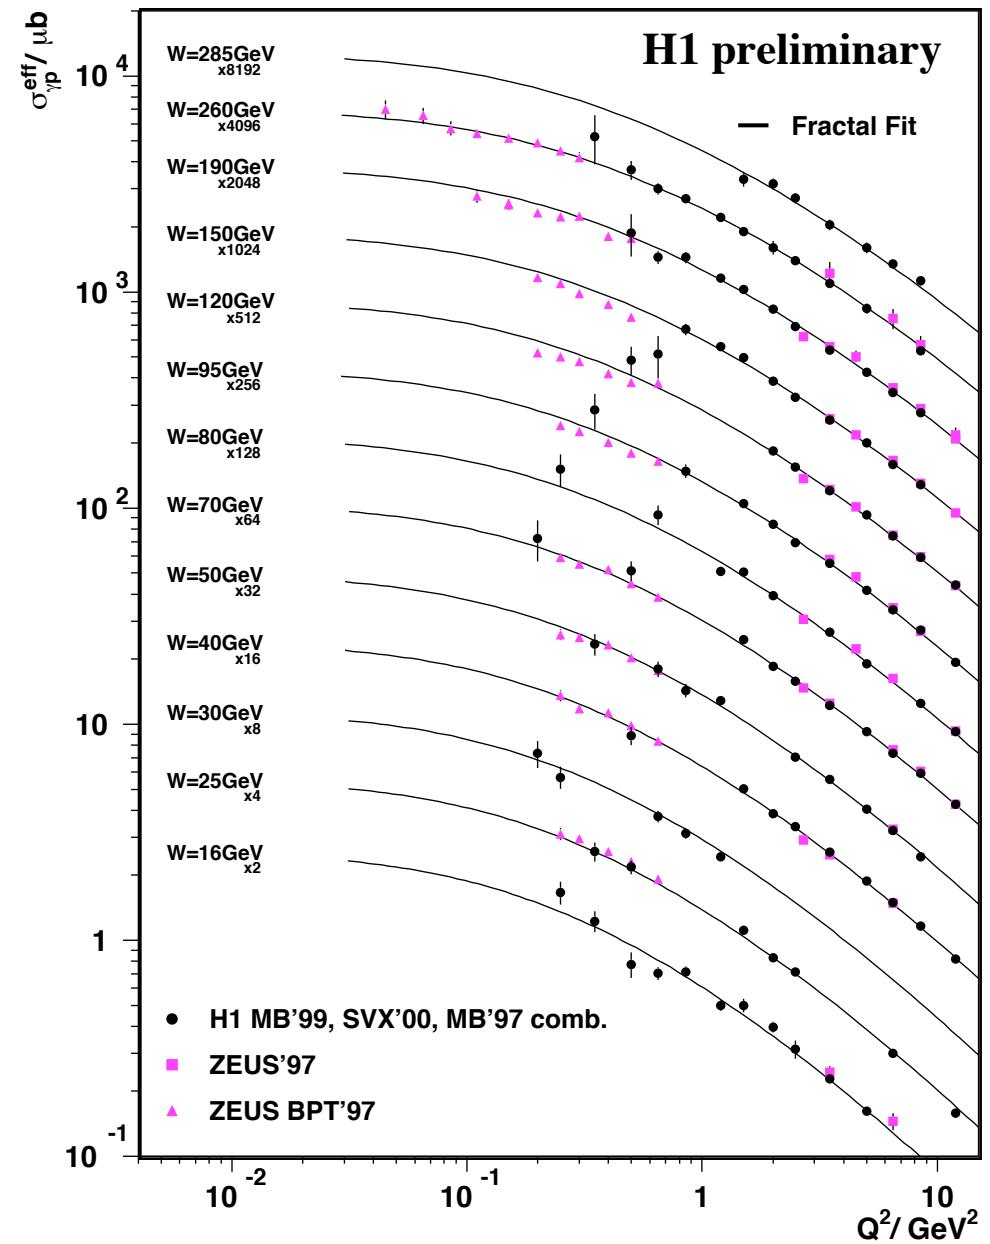

Recent Low Q^2 Results

H1 Data fill gap
in transition region

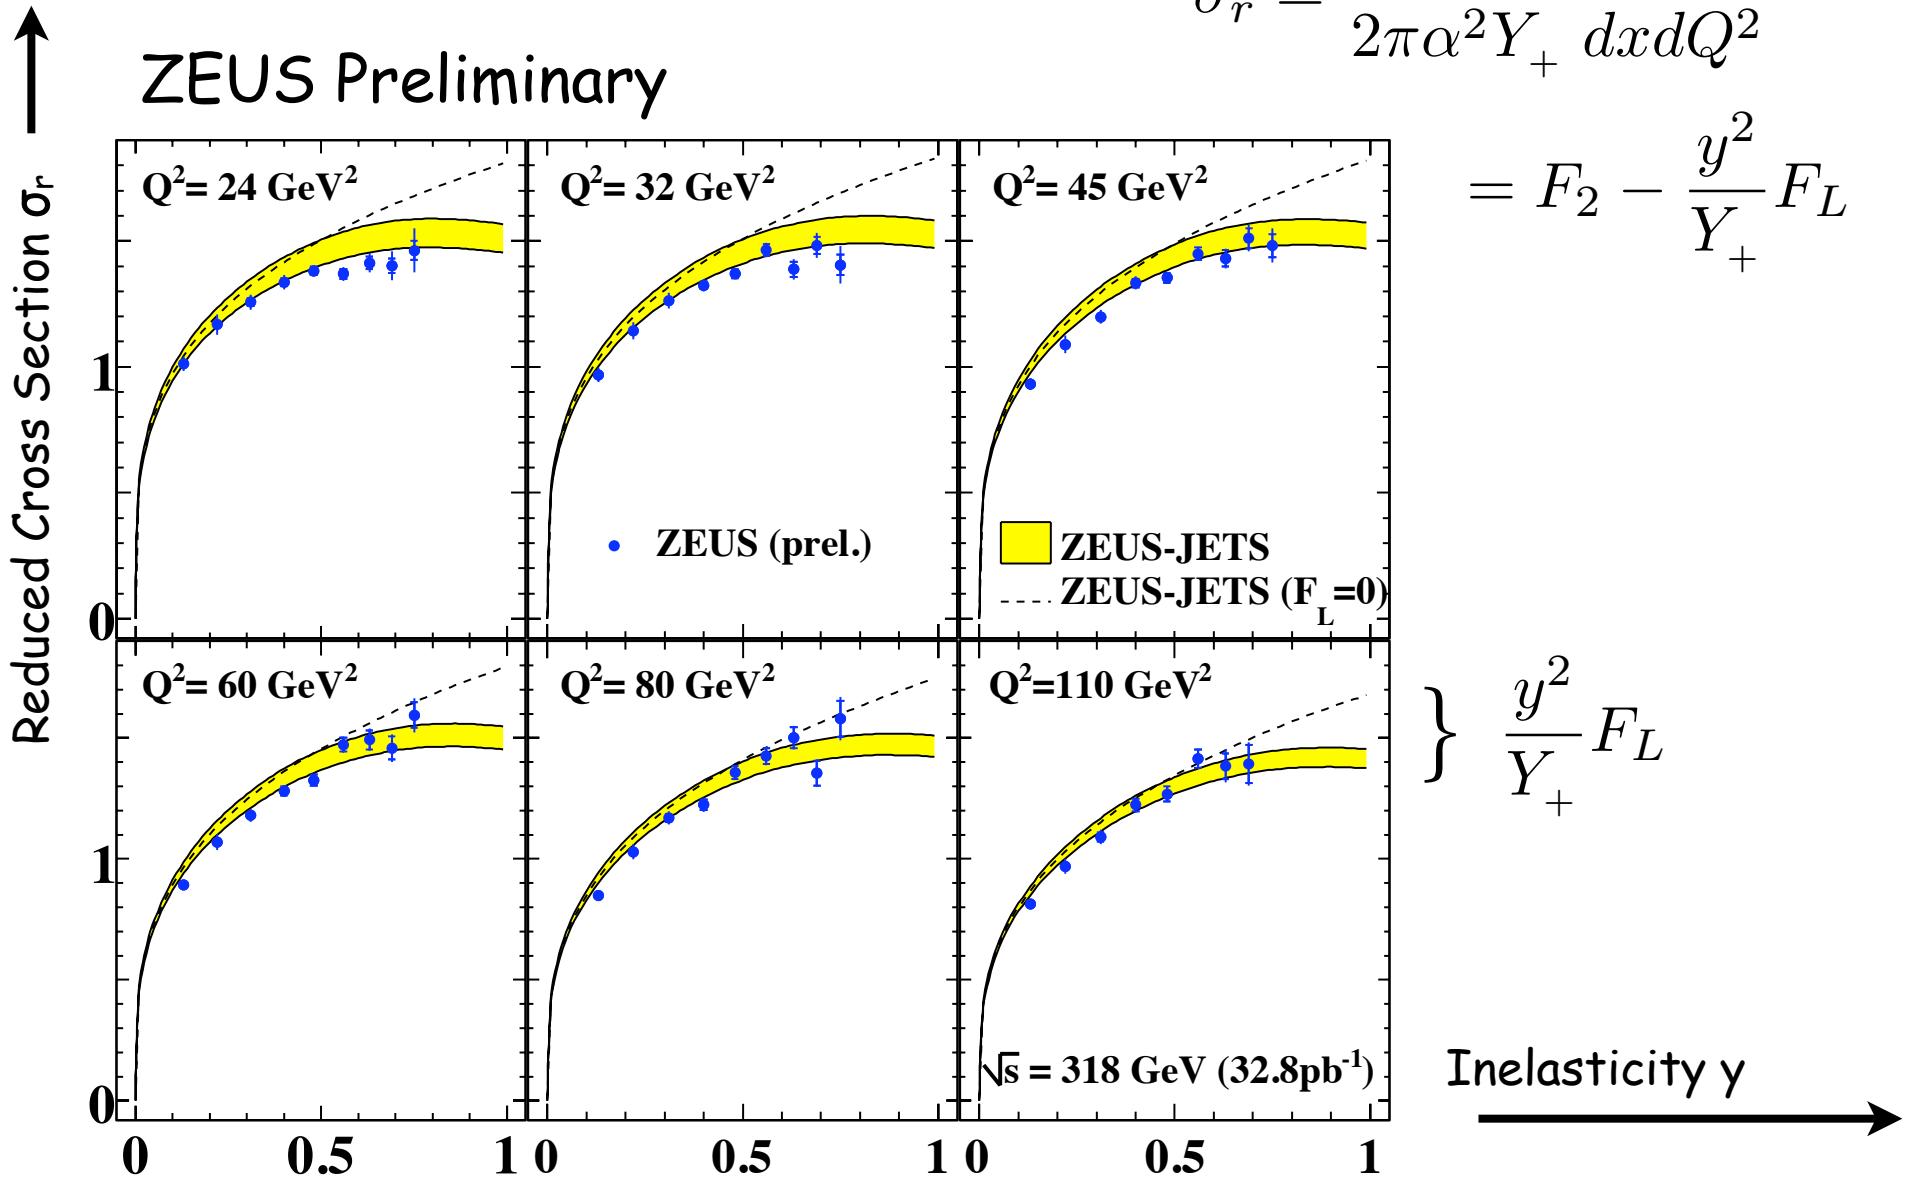

Agreement with ZEUS
in regions of overlap

Comparison to
phenomenological models
[here: fractal fit]

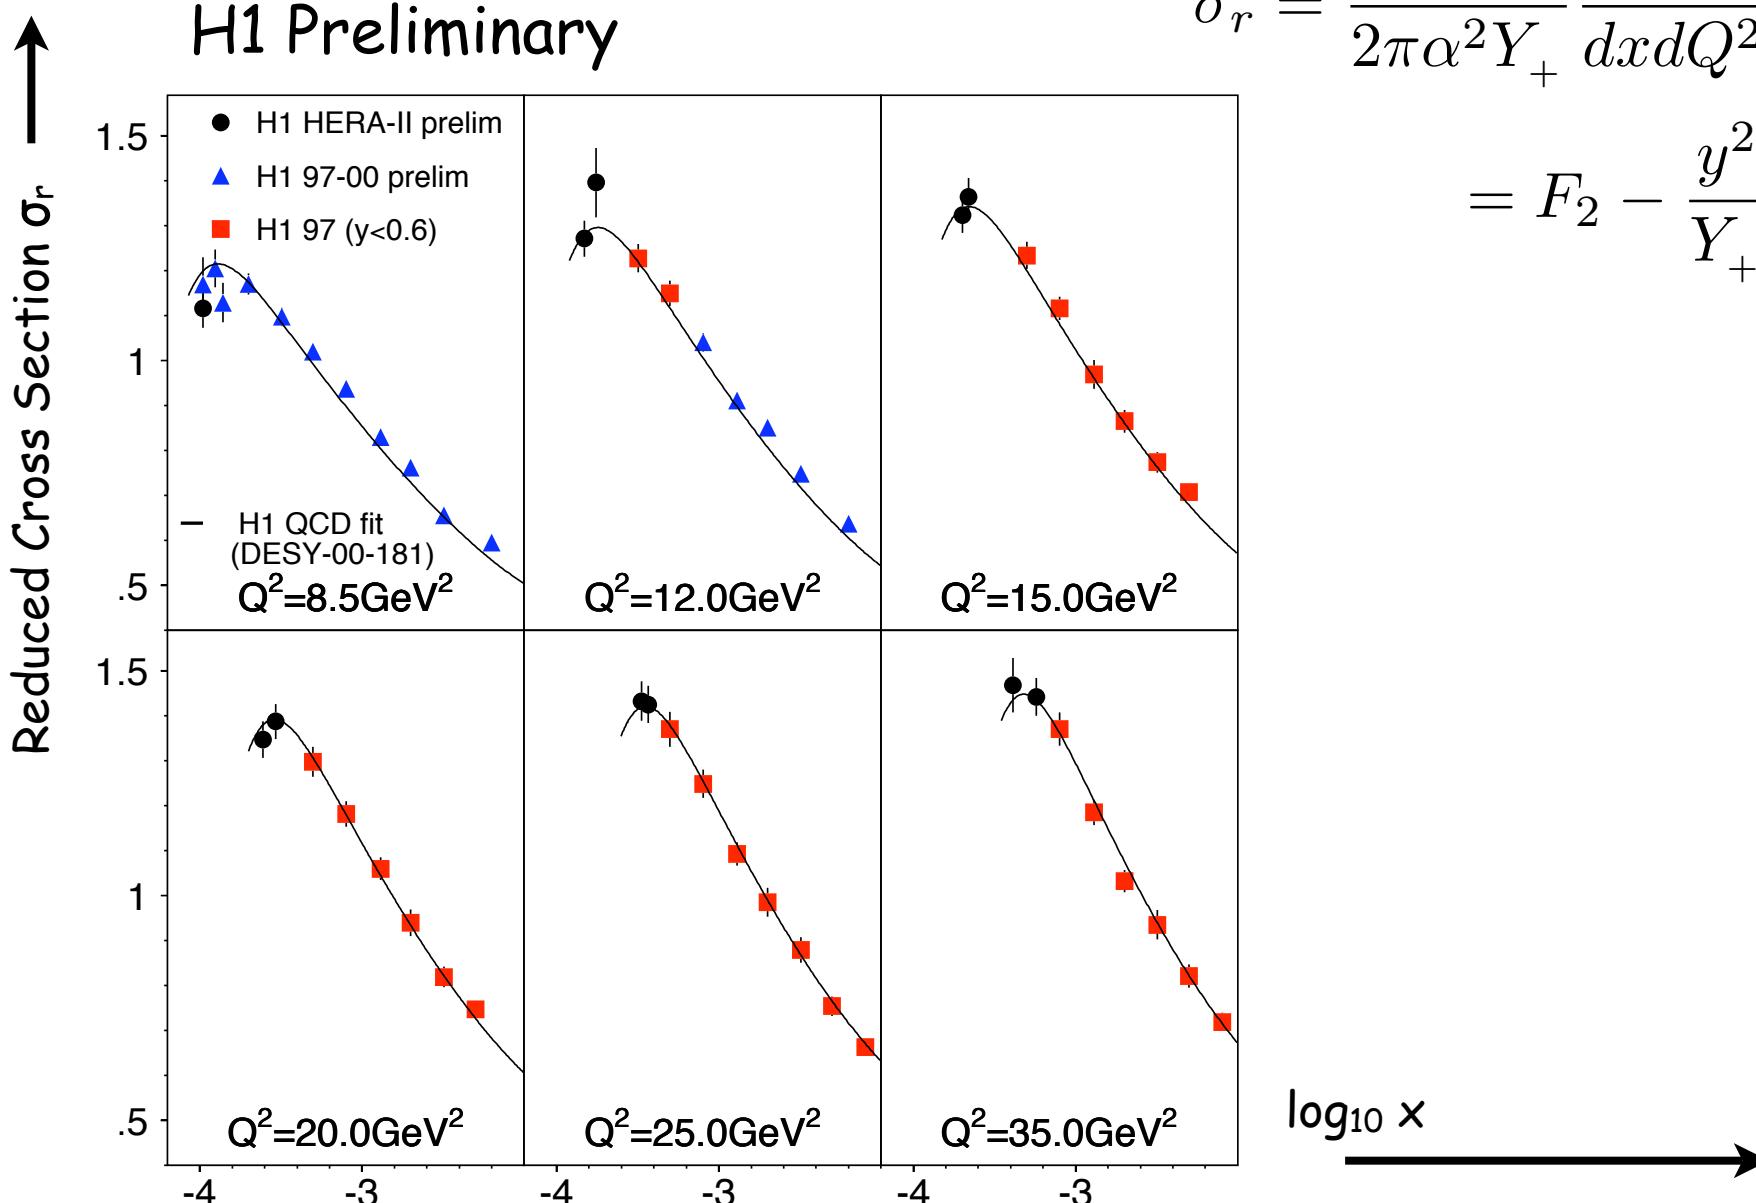

High y & F_L

Recent High γ Measurements

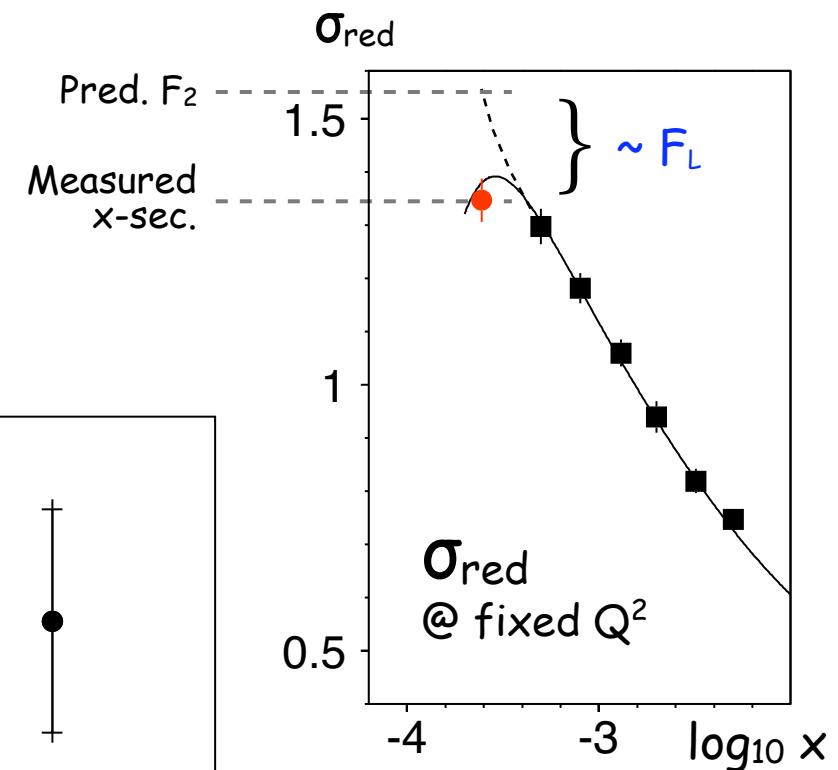

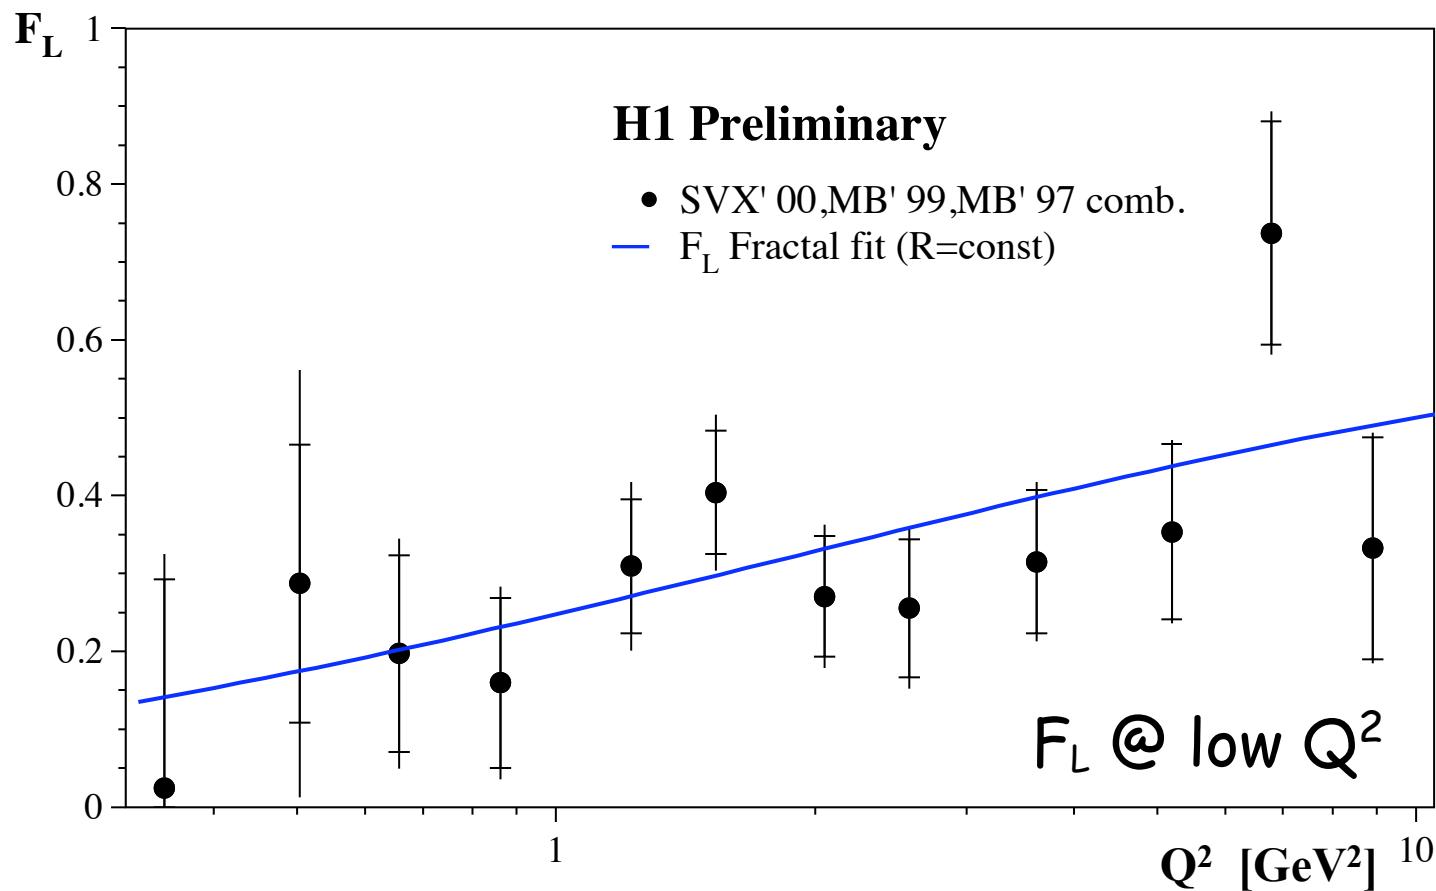

Recent High y Measurements

F_L : Indirect Determination

Extrapolate F_2 and determine F_L via: $F_L \sim F_2 - \sigma_r$

[Drawback: Requires assumption on F_2]

Extraction via:

$$\sigma_{\text{fit}} = cx^{-\lambda} - \frac{y^2}{Y_+} F_L$$

[shape method]

F_L : Direct Measurement

Reduced Cross Section:

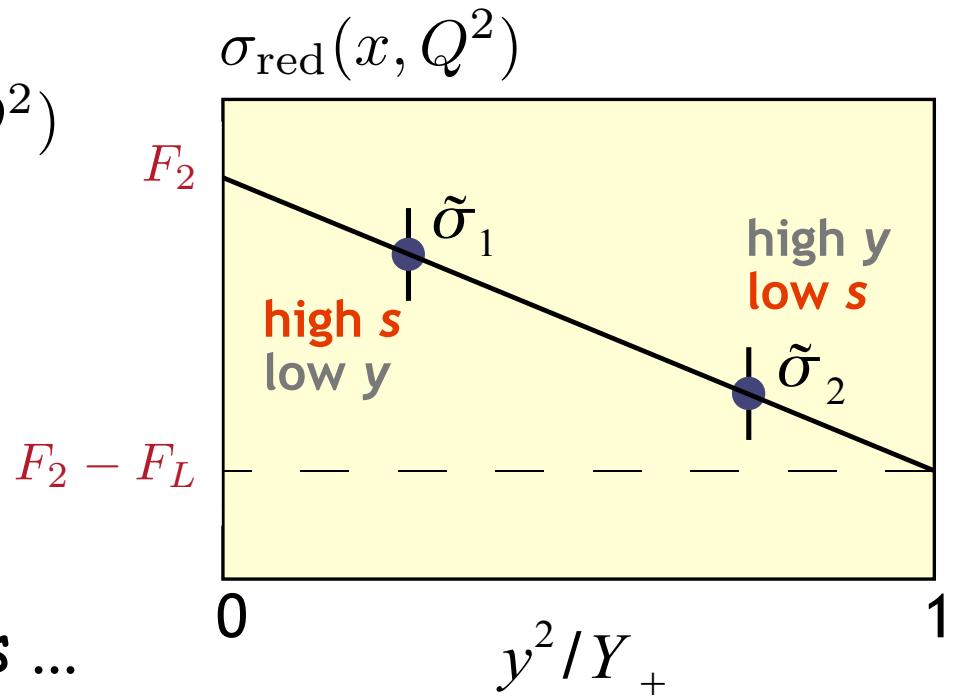

$$\sigma_{\text{red}} = F_2(x, Q^2) - \frac{y^2}{Y_+} F_L(x, Q^2)$$

Cross section measurements
at different y -values ...

i.e. due to

$$Q^2 = sxy$$

... at different beam energies ...

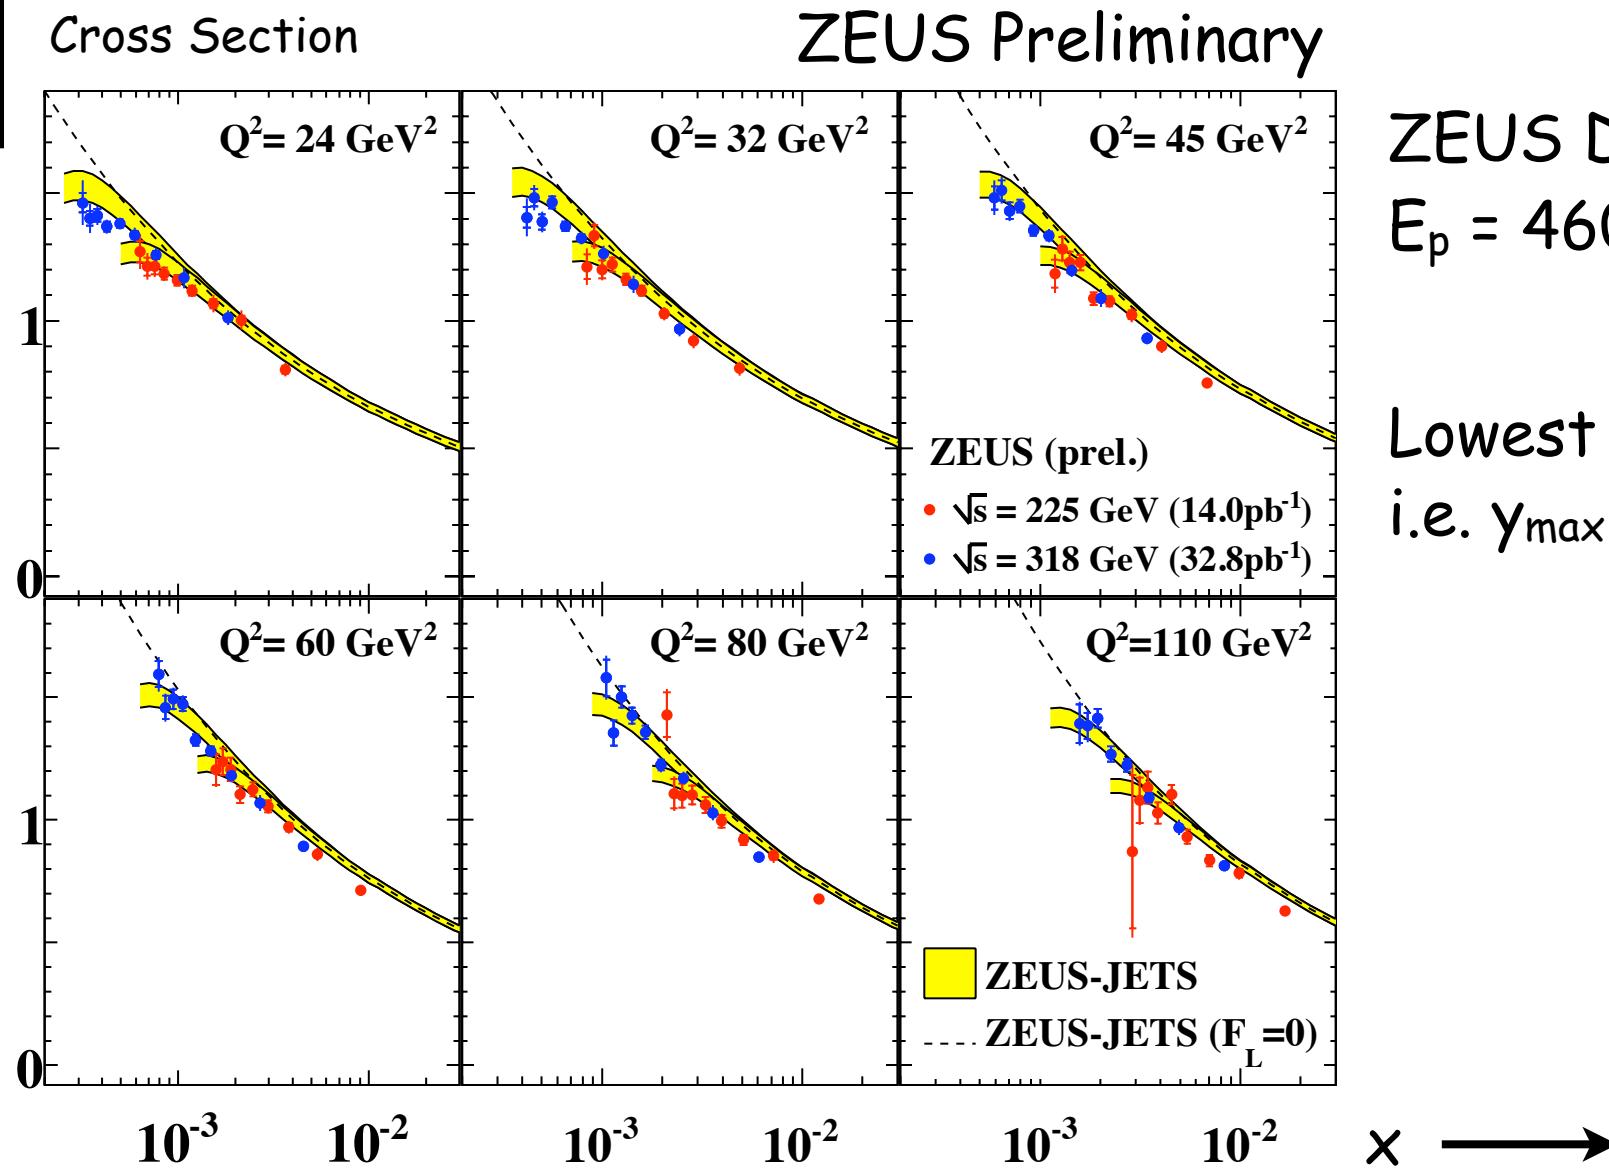

$$F_L(x, Q^2) = \frac{\sigma_{\text{red}}(x, Q^2, y_1) - \sigma_{\text{red}}(x, Q^2, y_2)}{Y_2^2/Y_{2,+} - Y_1^2/Y_{1,+}}$$

→ End of HERA II: Low energy runs @ 460 & 575 GeV

u_v uncertainty reduced
at high x and high Q^2

improvement up to
large Q^2 [e.g. $Q^2 = 10000 \text{ GeV}^2$]

Electroweak & QCD Fit

Electroweak
couplings v_u, a_u

Rem.: larger uncertainties for v_d, a_d
due to lower sensitivity of NC to d-quarks

Limits competitive
HERA results
resolve LEP ambiguity

Combining Data

HERA I Combined Cross Section

Based on
published HERA I Data

H1 NC min. bias

H1 NC low Q^2

H1 NC 94-97, 98-00

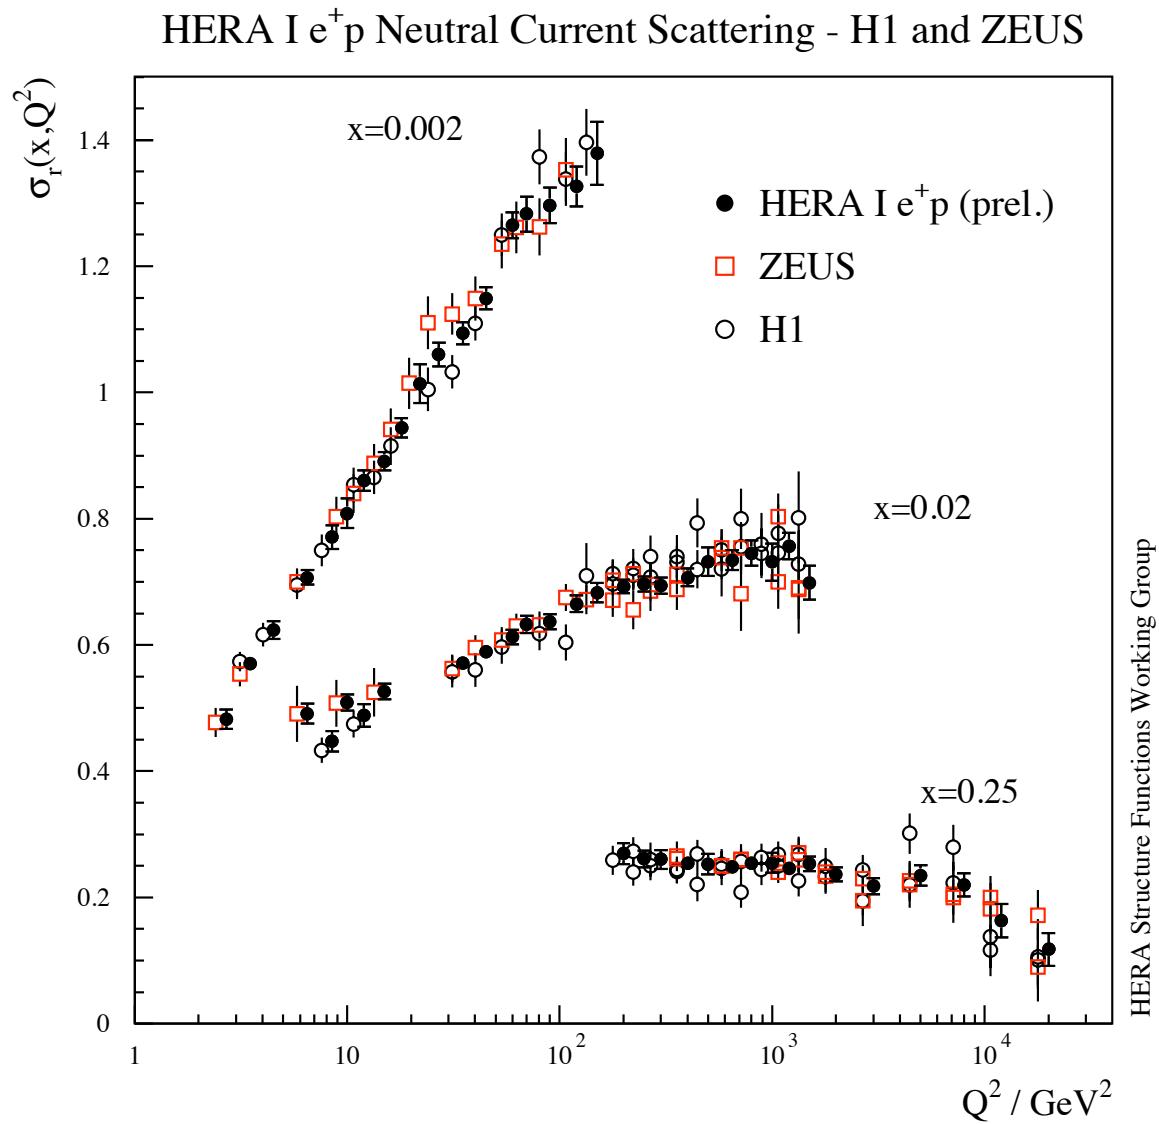

H1 CC 94-97, 98-00

ZEUS NC 96-97, 98-00

ZEUS CC 96-97, 98-00

e^+p & e^-p data
@ 820 & 920 GeV

HERA I Combined Cross Section

Based on
published HERA I Data

Method:

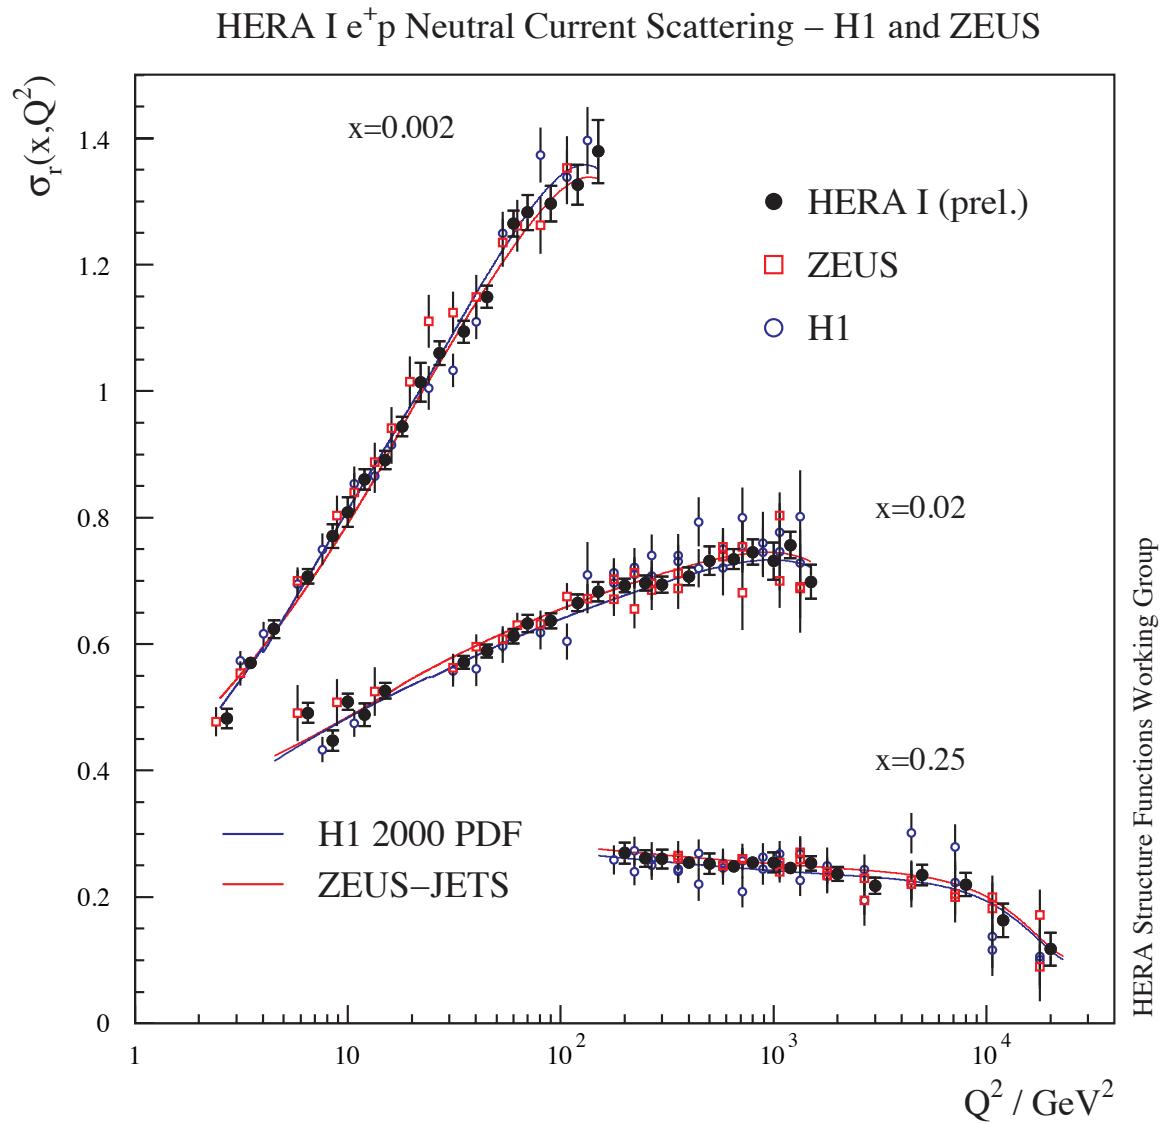

Move all data
to common $x-Q^2$ grid

Correct for different
beam energies ...

Calculate average
values using χ^2 -Method

Key assumption:
H1 & ZEUS measure
same cross section

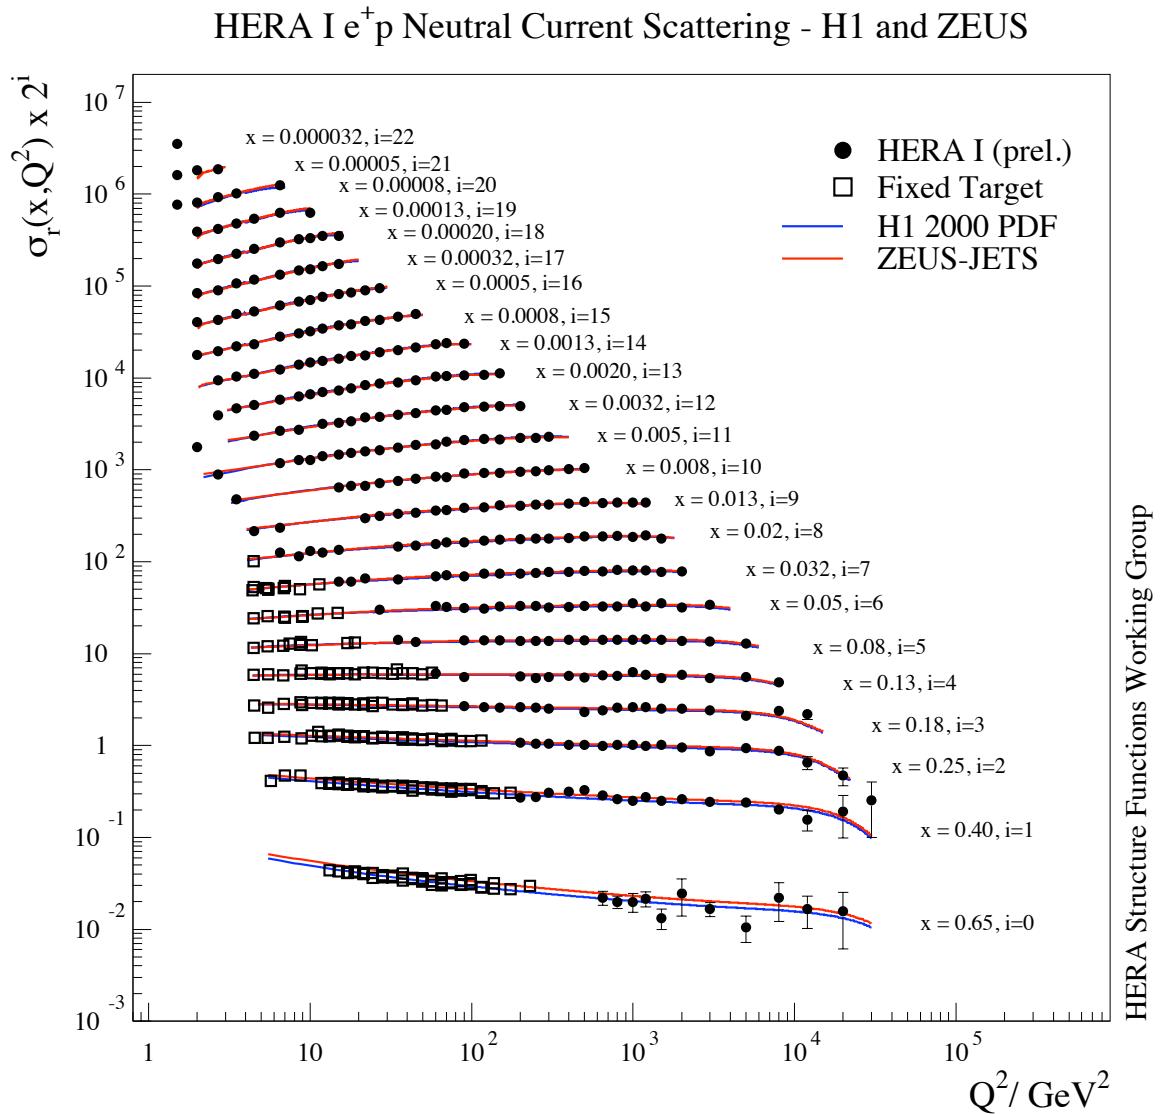

HERA I Combined Cross Section

Uncertainties
greatly reduced
[Statistical & systematic]

Good agreement with
H1 and ZEUS PDF Fits

HERA I Combined Cross Section

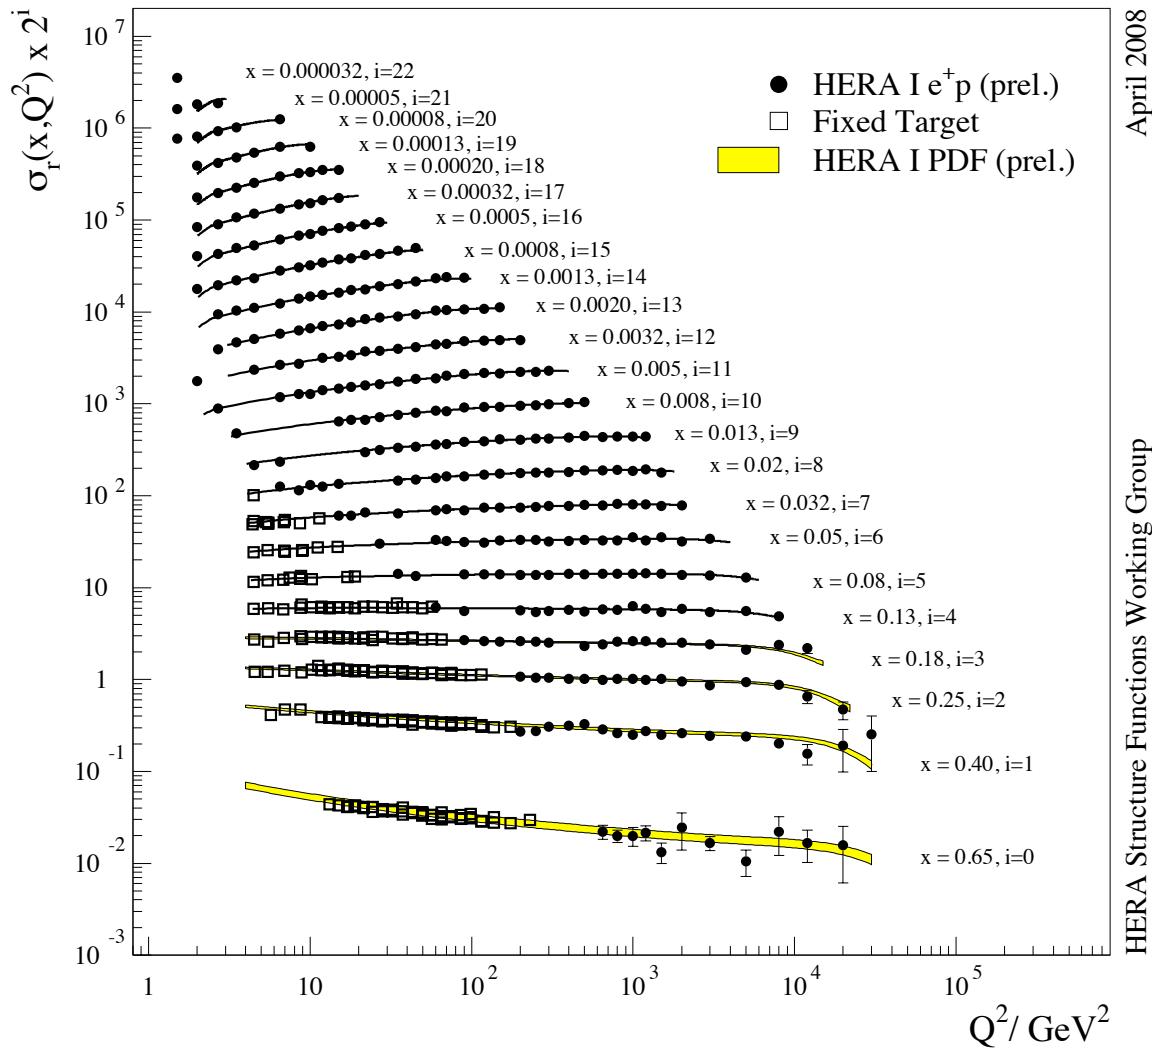

Uncertainties
greatly reduced
[Statistical & systematic]

Good agreement with
H1 and ZEUS PDF Fits

HERA I Combined PDF Fit

H1 and ZEUS Combined PDF Fit

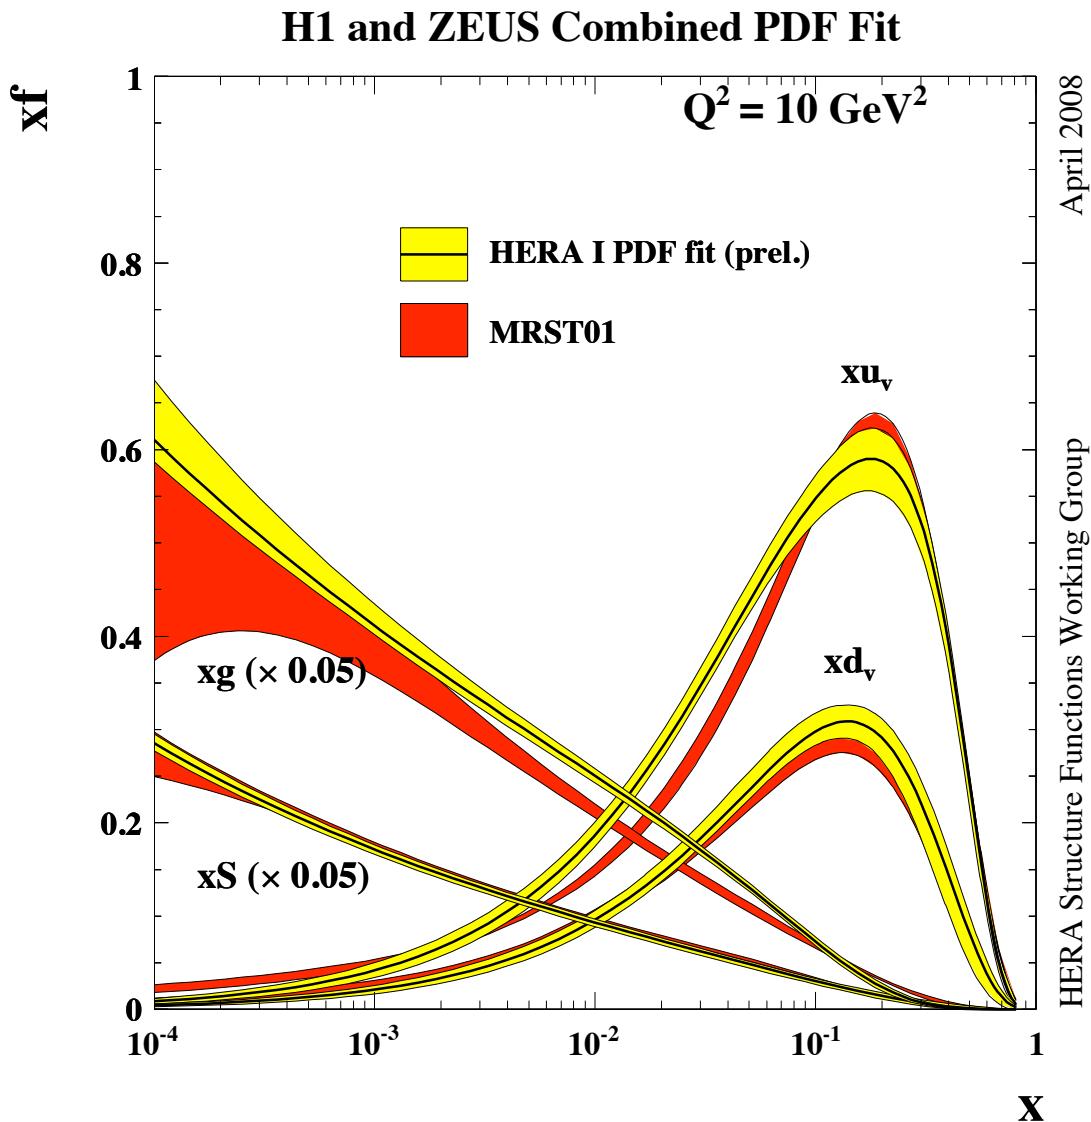

New PDFs
with reduced errors

Fits performed at NLO
[using DGLAP & ZMVFNS]

- $Q^2_{\min} = 3.5 \text{ GeV}^2$
- $\chi^2/\text{ndf} = 476.7/562$

HERA I Combined PDF Fit

New PDFs
with reduced errors

Fits performed at NLO
[using DGLAP & ZMVFNS]

- $Q^2_{\min} = 3.5 \text{ GeV}^2$
- $\chi^2/\text{ndf} = 476.7/562$

Summary

- 1 **Low Q^2 :** shifted vertex and min. bias data; gap in transition region filled.
- 2 **High y :** Direct & indirect F_L determination; sensitivity to gluon density.
- 3 **High Q^2 :** New polarized cross sections; combined EW & QCD Fits
- 4 **Data combination:** H1 & ZEUS NC/CC data; reduced uncertainties; combined PDF fits.

Backup Slides

H1 Data Combination

combination of data sets **requires** a proper handling of systematic & statistical errors.

Let Λ^i a set of cross section measurement, then Λ^{Ave} is obtained:

$$\chi^2(\Lambda^{Ave}, \alpha) = \sum_{k=1}^{\text{exp}} \sum_i^{\text{bins}} \frac{\left[\Lambda^{i, Ave} - \left(\Lambda_i^k + \sum_{j=1}^{\text{syst}} \frac{\partial \Lambda_i^k}{\partial \alpha_j^k} \alpha_j^k \right) \right]^2}{\sigma_{\Lambda_i^k}^2} + \sum_{k=1}^{\text{exp}} \sum_{j=1}^{\text{syst}} \frac{(\alpha_j^k)^2}{\sigma_{\alpha_j^k}^2}$$

◆ Input:

$\Lambda^i, \frac{\partial \Lambda_i}{\partial \alpha_j}, \sigma_{\Lambda,i}^2, \sigma_{\alpha_j}^2$ uncertainty on the source
sensitivity to syst stat+uncorr uncertainty

◆ Output:

Λ^{True}, α_j
shift on the uncertainty of the source

Combining H1 & ZEUS Data

$$\chi_{\text{exp}}^2 \left(M^{i,\text{true}}, \Delta\alpha_j \right) = \sum_i \frac{\left[M^{i,\text{true}} - \left(M^i + \sum_j \frac{\partial M^i}{\partial \alpha_j} \Delta\alpha_j \right) \right]^2}{\sigma_i^2} + \sum_j \frac{\Delta\alpha_j^2}{\sigma_{\alpha_j}^2}$$

M^i measured central values

σ_i statistical and uncorrelated systematic uncertainties

$\sigma_{\alpha_j}^2$ correlated uncertainty

$\frac{\partial M^i}{\partial \alpha_j}$ sensitivity of the data to the systematic source j

$M^{i,\text{true}}$ fitted H1-ZEUS combined H1-value

$\frac{\partial M^i}{\partial \alpha_j} \Delta\alpha_j$ fitted shift of the i data due to the j sys error source

It's a cross calibration of the correlated systematics between different data sets. If $\Delta\alpha_j = 0$, it coincides with a standard average

Combining H1 & ZEUS Data

$$\chi^2_{\text{exp}} \left(M^{i,\text{true}}, \Delta\alpha_j \right) = \sum_i \frac{\left[M^{i,\text{true}} - \left(M^i + \sum_j \frac{\partial M^i}{\partial \alpha_j} \frac{M^{i,\text{true}}}{M^i} \Delta\alpha_j \right) \right]^2}{\left(\sigma_i \frac{M^{i,\text{true}}}{M^i} \right)^2} + \sum_j \frac{\Delta\alpha_j^2}{\sigma_{\alpha_j}^2}$$

Normalisation is clearly relative (multiplicative).

Are the other systematics errors additive or multiplicative ? Debatable !

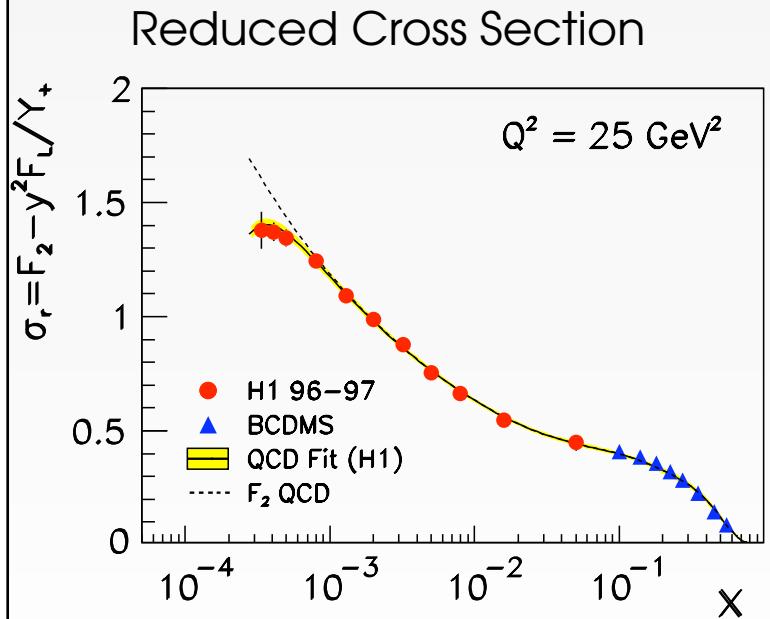

Impact is mostly negligible, except at very large Q^2 and x where statistical errors and fluctuations are the largest.

At that stage : an additional uncertainty has been added.

F_L : Indirect Determination Methods

$$\sigma_r = F_2(x, Q^2) - \frac{y^2}{Y_+} F_L(x, Q^2)$$

- Data sensitive at highest y only
- Direct measurement requires data at different $s \rightarrow$ *lower E_p runs*
- Indirect determination at high y

- ▶ Derivative method

$$\left. \frac{\partial \sigma_r}{\partial \ln y} \right|_{Q^2} \approx \left. \frac{\partial F_2}{\partial \ln y} \right|_{Q^2} - \frac{2y^2(2-y)}{Y_+^2} F_L$$

Derivative dominated by F_L term at high y

- ▶ Shape method

$$\sigma_{\text{fit}} = cx^{-\lambda} - \frac{y^2}{Y_+} F_L$$

Shape driven by kin. factor rather than F_L
