

# $ep$ physics at high $Q^2$

Thomas Hadig  
on behalf of the H1 and ZEUS Collaborations

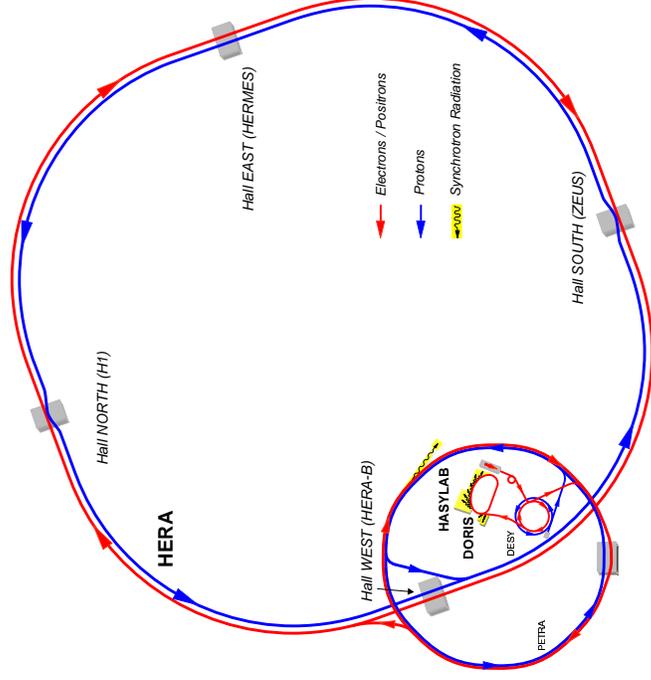

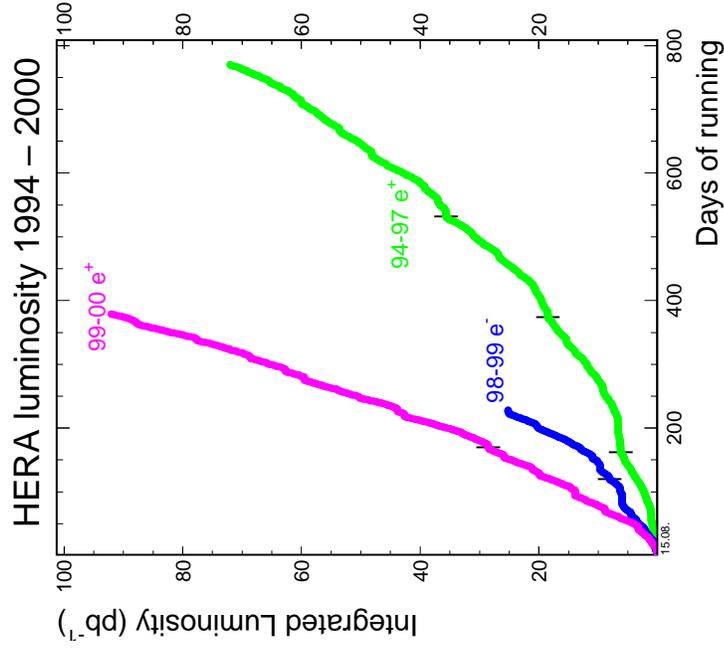

August, 24th 2000

- HERA
- Standard Model
  - + Inclusive Cross Section
- Beyond the Standard Model
  - + Isolated Lepton Events
  - + Single Top Production
  - +  $R_p$  Processes
- Summary

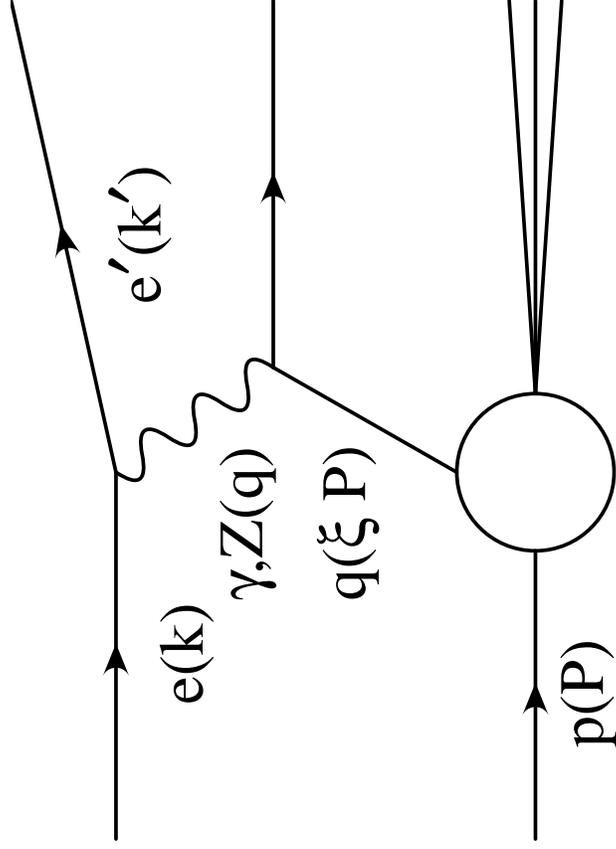

Thomas Hadig, SLAC Summer Institute, 24.8.2000

# HERA

World only  $ep$  collider:  $e^\pm @ 27.5\text{GeV}$   $p @ 920\text{GeV}$   $\sqrt{s} = 320\text{GeV}$  (98 – 00)  
 Each experiment collected more than  $100\text{ pb}^{-1}$  of data.

# Kinematics

$Q^2 = -q^2$  virtuality of photon  
 $\xi$  momentum fraction of parton wrt. proton

$$y = \frac{P(k - k')}{Pk} \text{ inelasticity}$$

$$x = \frac{Q^2}{ys}$$

High  $Q^2$  means high  $x$  or  $y$

In first approximation:  $x = \xi$

## Neutral Current Cross Section

NC (neutral current) : exchange of  $\gamma$  or Z, observation of scattered  $e$

$$\frac{d^2\sigma_{NC}^{\pm}}{dx dQ^2} = \frac{2\pi\alpha^2}{xQ^4} \left[ Y_+ \tilde{F}_2 \mp Y_- x \tilde{F}_3 - y^2 \tilde{F}_L \right]$$
$$Y_{\pm} = 1 \pm (1 - y)^2$$

Global dependence:  $\frac{1}{Q^4}$ .

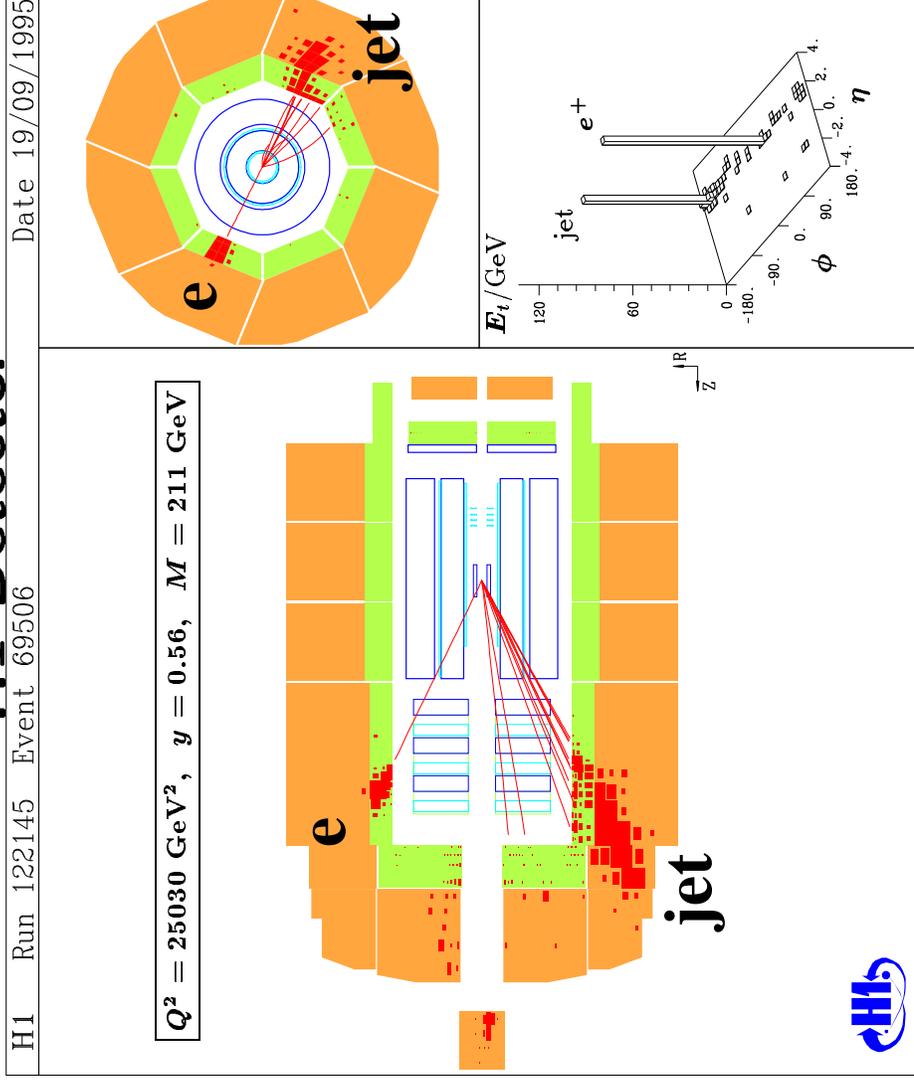

At high  $y$  : Contributions from  $F_L$ , but  $F_L$  decreases for increasing  $Q^2$

$x F_3$  : parity violating term from Z and  $\gamma$ Z interference graphs

At high  $x$  : Contributions from  $F_3$

Sign of  $x F_3$  contribution depends on incoming lepton charge

# H1 Detector

NC (neutral current) : exchange of  $\gamma$  or Z, observation of scattered  $e$

## Charged Current Cross Section

$$\frac{d^2 \sigma_{NC}^{\pm}}{dx dQ^2} = \frac{2\pi\alpha^2}{xQ^4} \left[ Y_+ \tilde{F}_2 \mp Y_- x \tilde{F}_3 - y^2 \tilde{F}_L \right]$$

CC (charged current) : exchange of  $W^{\pm}$ ,  $\nu$  leaves undetected (missing  $p_t$ )

$$\frac{d^2 \sigma_{CC}^{\pm}}{dx dQ^2} = \frac{G_F^2}{2\pi x} \left( \frac{M_W^2}{M_W^2 + Q^2} \right)^2 x \left[ (u + c) + (1 - y^2)(\bar{d} + \bar{s}) \right]$$

At low  $Q^2$  : CC process suppressed wrt. NC

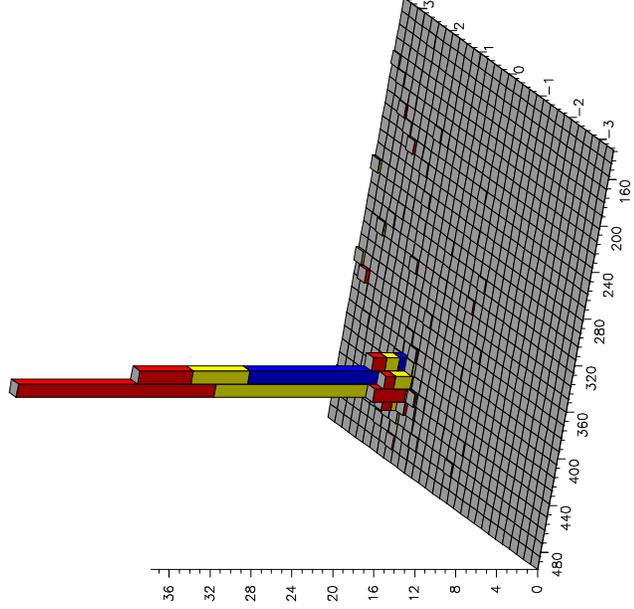

Up and Charm density in the proton

Down and Strange density in the proton

# ZEUS Detector

ZR

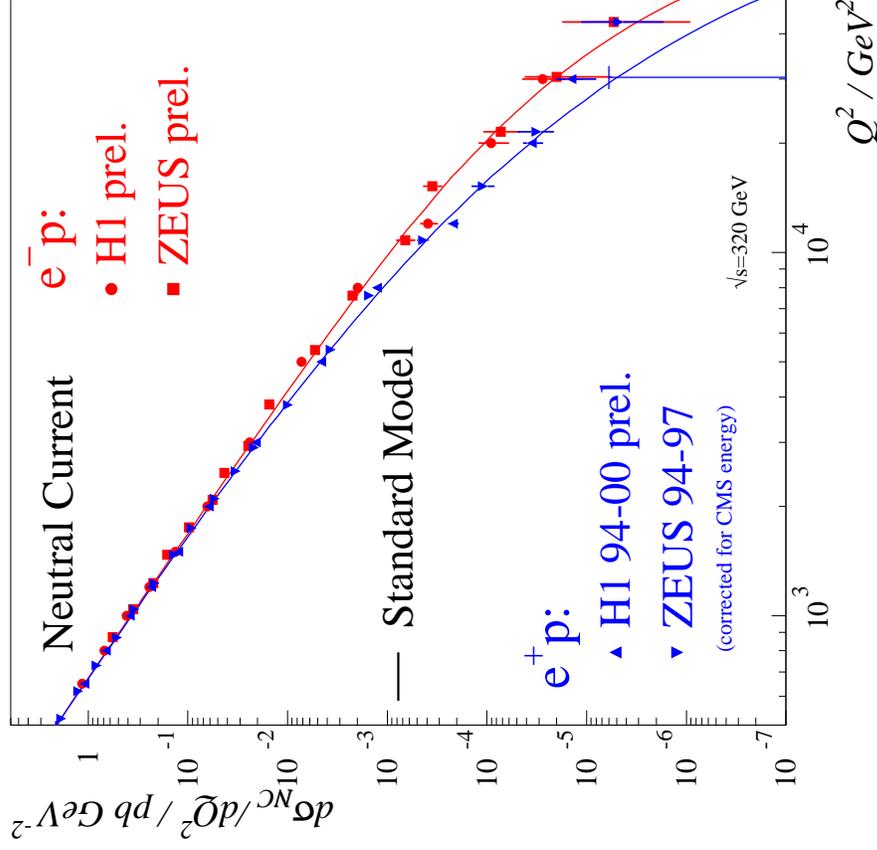

CC (charged current) : exchange of  $W^\pm$ ,  $\nu$  leaves undetected (missing  $p_t$ )

# Comparison : NC vs. CC

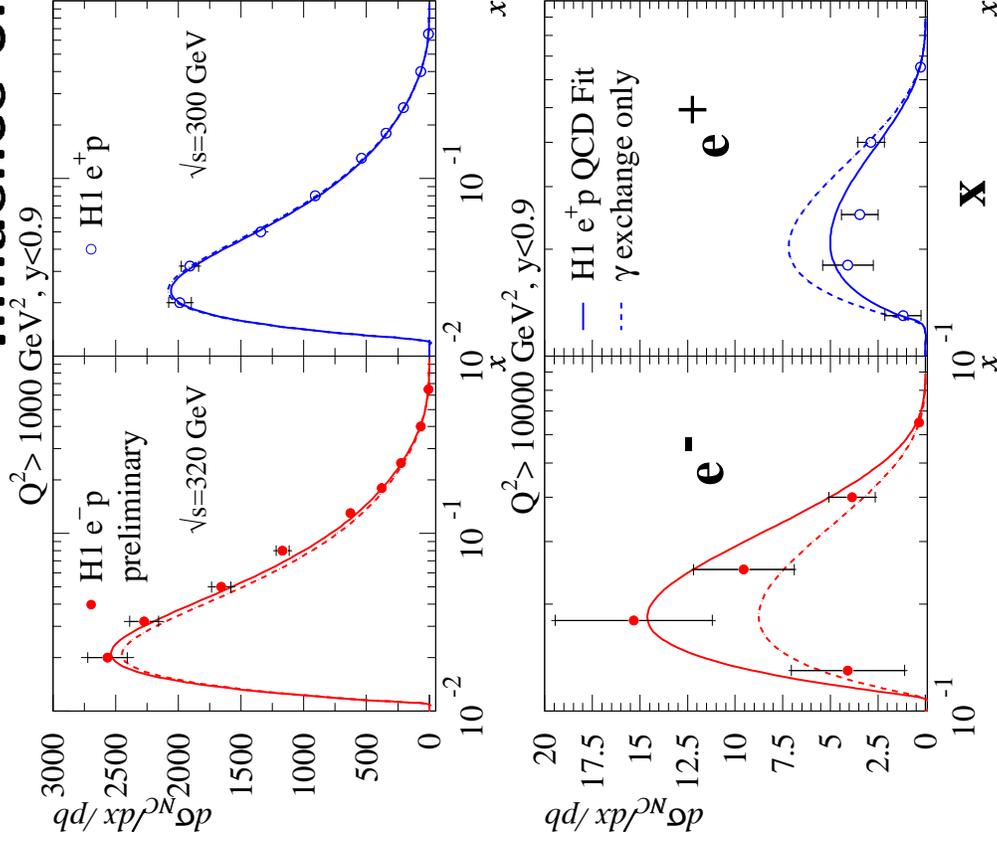

Neutral current and Charged Current cross section well described by Standard Model  
 CC suppressed wrt. NC  
 At high  $Q^2$  suppression is smaller.  
 Electroweak unification:  $\sigma_{\gamma,Z} \approx \sigma_W$

# Comparison : Incoming Electron vs. Positron

$e^+p$  and  $e^-p$  NC cross section is well described by Standard Model  
 Difference in  $\sigma_{e^+p}$  and  $\sigma_{e^-p}$  seen at high  $Q^2$  (high  $x$ ).

# Influence of Z exchange

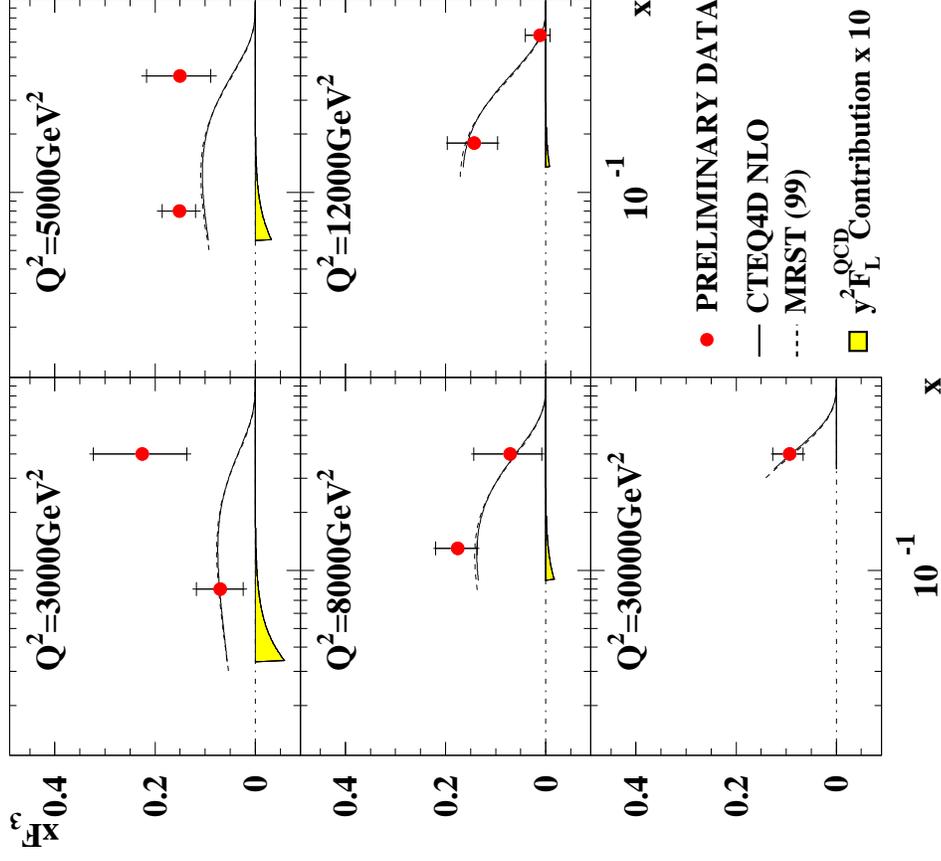

NC cross section is mainly dominated by photon exchange.

Influence of Z seen at high  $Q^2$ .

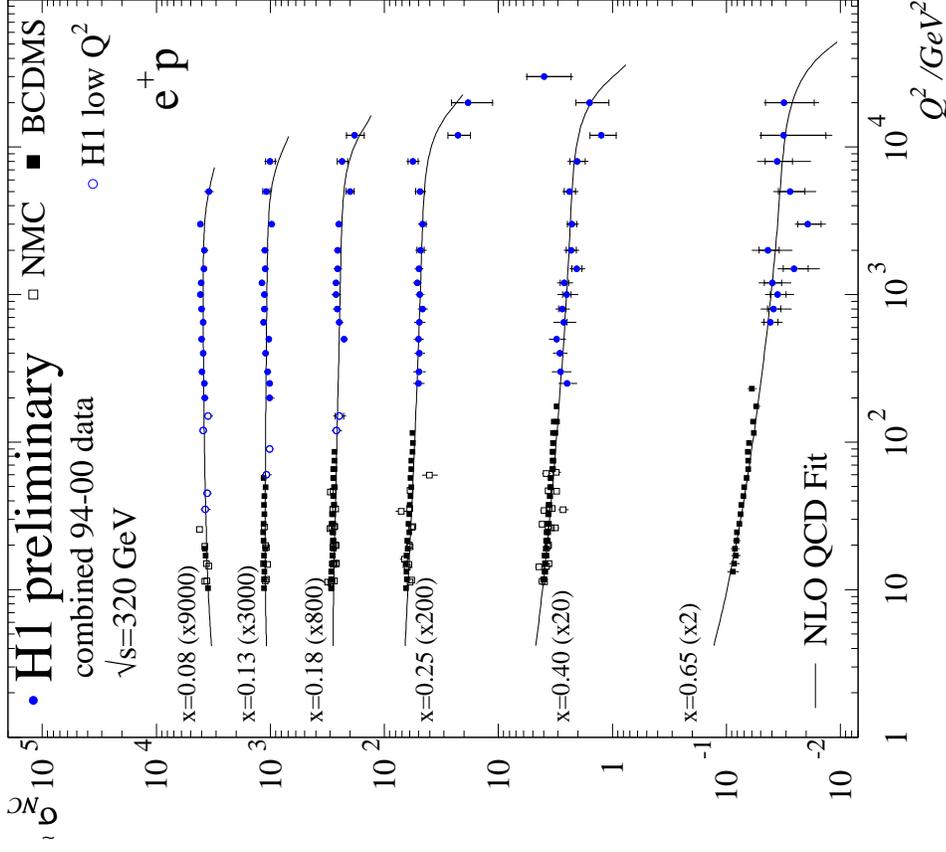

Interference of photon and Z is different for  $e^+$  and  $e^-$ .

# ZEUS NC 1996-99 $x F_3$ Extraction

Extraction of  $x F_3(x, Q^2)$  at high  $x$   
 NLO QCD calculation describes data  
 $y^2 F_L$  contribution negligible  
 (only at small  $x$ , i.e. high  $y$ )

# Reduced Cross Section

Removing kinem. factors from  $\sigma_{\text{NC}}$

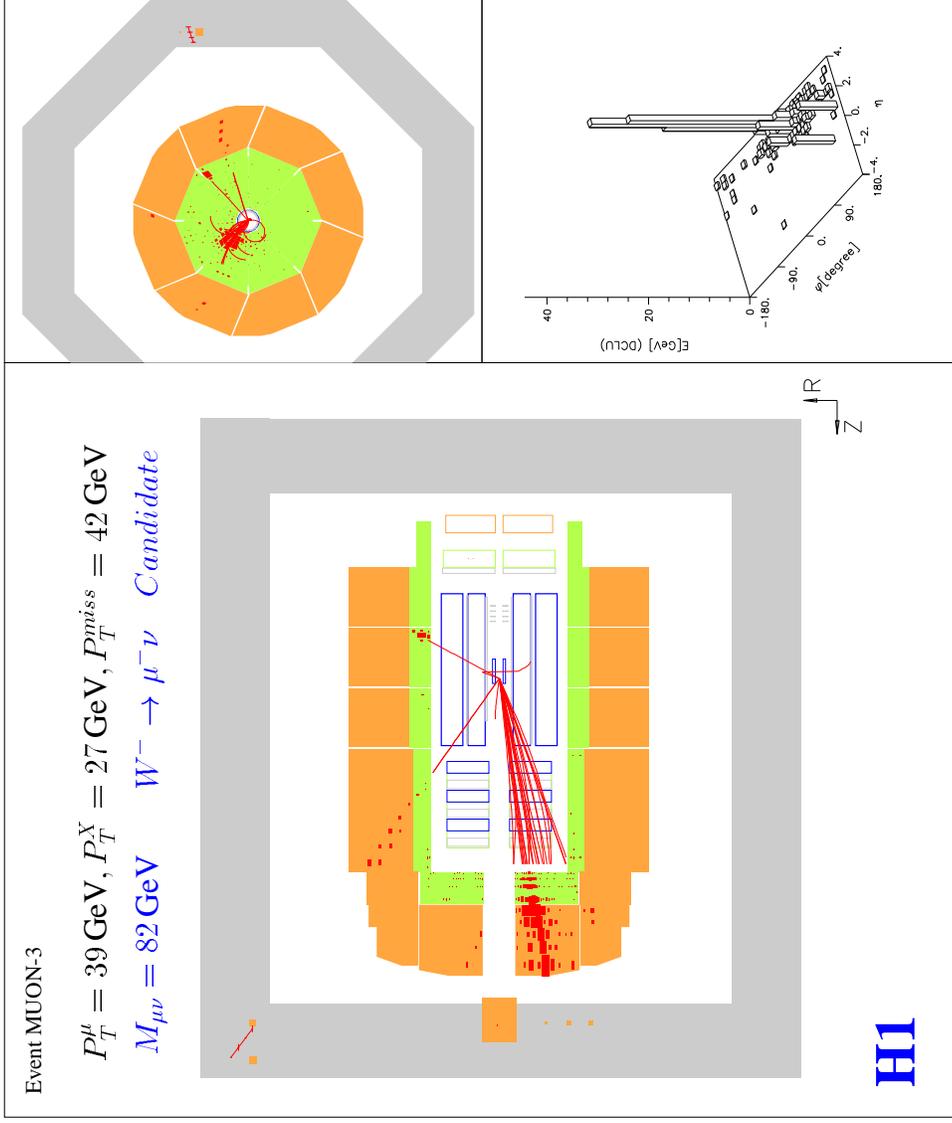

$$\tilde{\sigma}(x, Q^2) = \frac{1}{Y_+} \frac{Q^4 x}{2\pi\alpha^2} d^2\sigma_{\text{NC}}$$

Data connect well to fixed target data.

At small and medium  $Q^2$  :  
 approximately flat line  
 At high  $Q^2$  :  
 electro-weak effects

$\Rightarrow$  Now: Looking at final states for physics Beyond the Standard Model

# Isolated Lepton Events

- Signature:
- Missing  $p_t$
  - Isolated  $\mu$
  - Jet

# Isolated Lepton Events

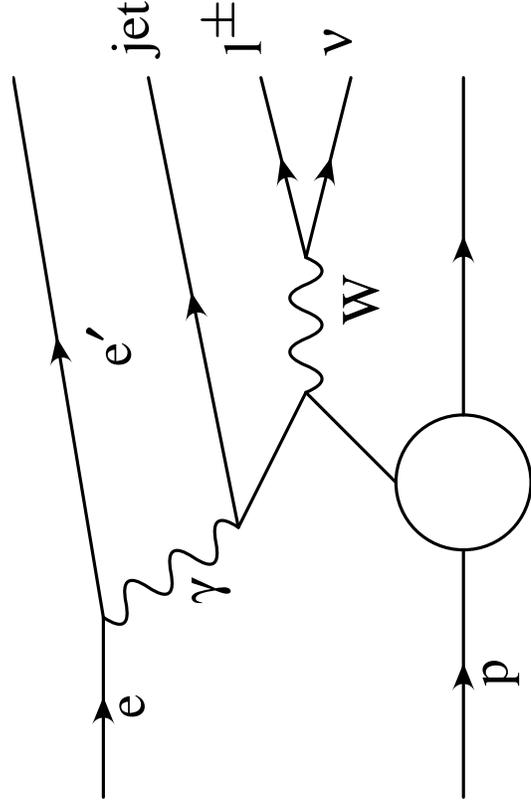

Explanation in Standard Model:

$W$  production

$$\sigma = 1 \text{ pb} \pm 30\%$$

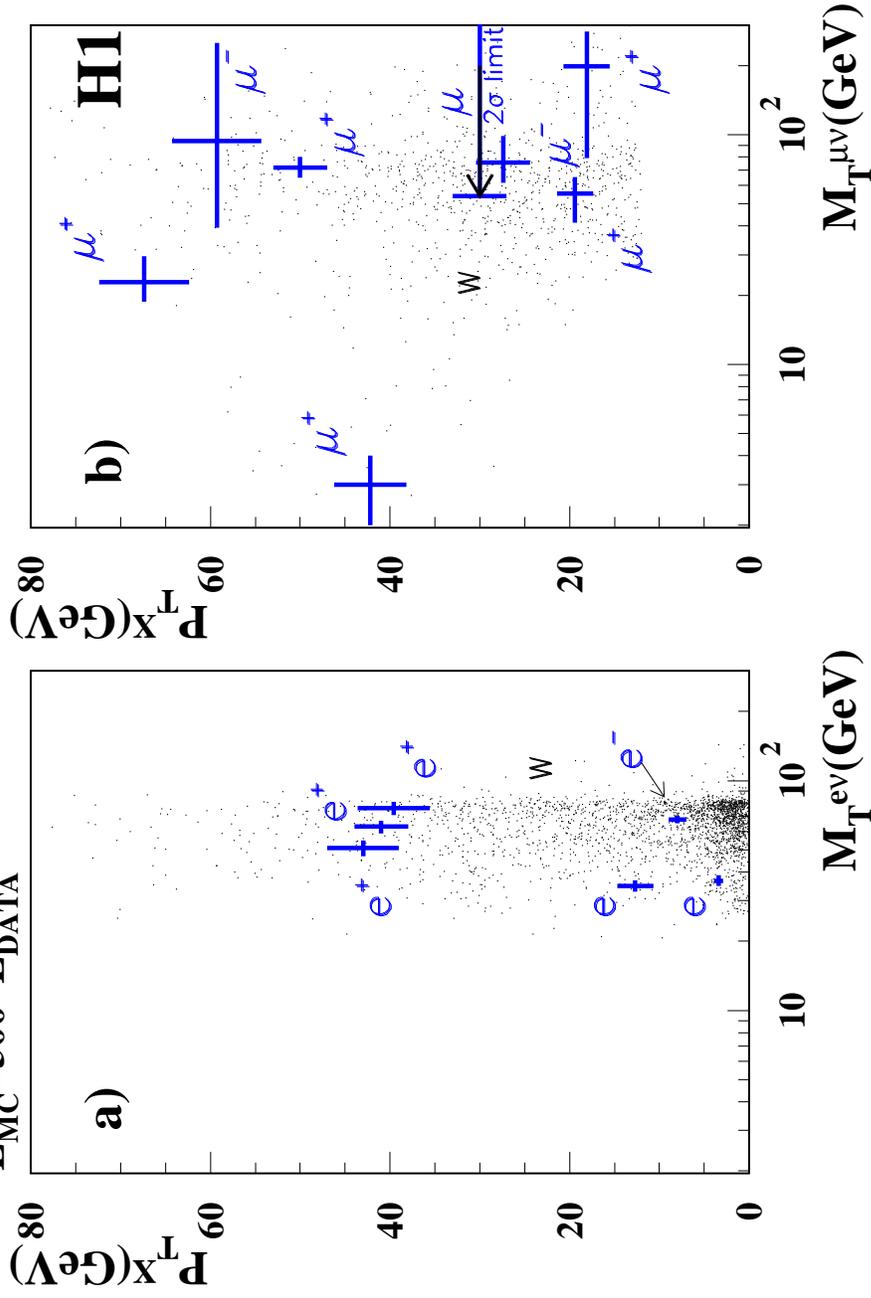

Signature:

- Scattered beam electron  
(mostly unobserved)
- Missing  $p_t^{\text{miss}}$
- Jet, measured, **small**  $P_T^X$
- Isolated lepton
- $\nu$  and lepton:  $M_{l\nu} \approx M_W$

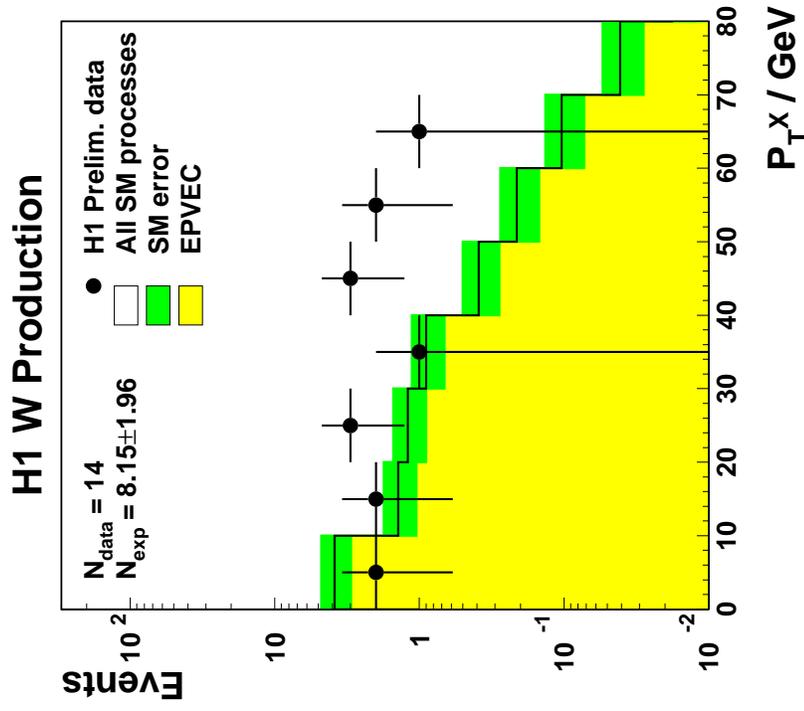

# Isolated Lepton Events

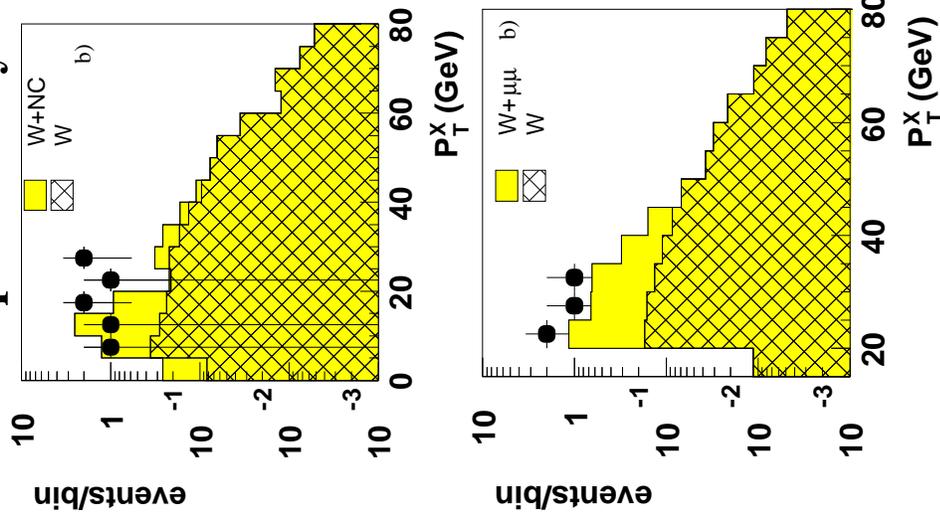

H1 PRELIMINARY 81.6pb<sup>-1</sup> e<sup>+</sup> p data 94-00  
 $L_{MC}=500*L_{DATA}$

# Isolated Lepton Events

### ZEUS 1994-1999 preliminary

H1 combined channels: excess at high  $p_t$   
 ZEUS:  $e$  (top) and  $\mu$  (bottom) channels

## Isolated Lepton Events

### Default analysis (combined $e$ and $\mu$ channels):

H1 preliminary, 94-00,  $e^+p$  only,  $82 \text{ pb}^{-1}$   
seen 9 events, expected  $2.3 \pm 0.6$  events

### H1 sees excess at large $p_t$

ZEUS, 94-99,  $e^+p$  and  $e^-p$  data,  $82 \text{ pb}^{-1}$   
seen 11 events, expected  $9.8 \pm 1.3$  events

### ZEUS is consistent with Standard Model

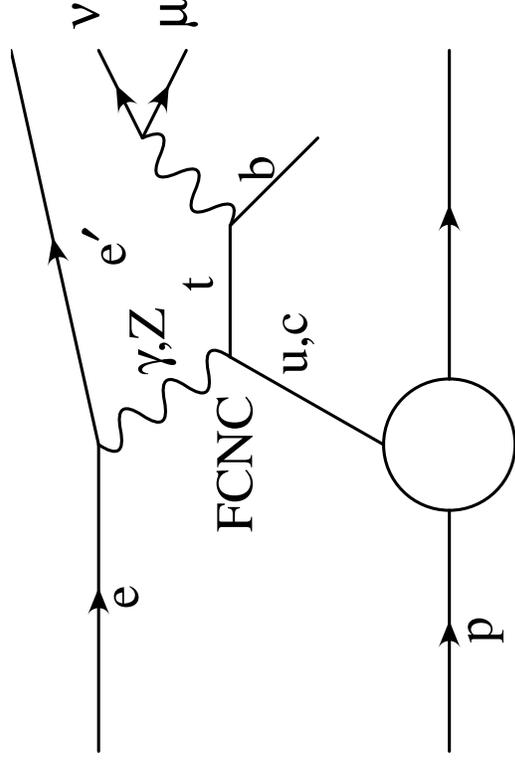

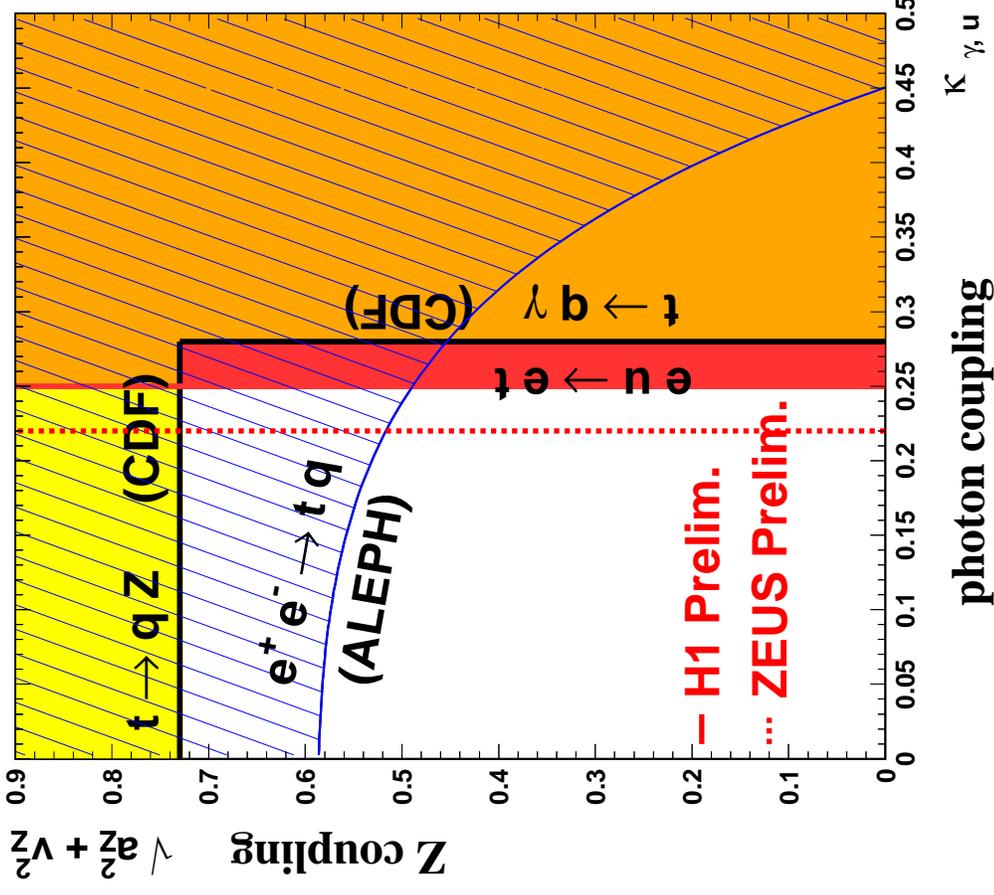

### For comparison: using similar cuts for H1 and ZEUS:

ZEUS: seen 1 event, expected 1.60

H1: seen 9 events, expected 1.78

### Background expectation of H1 and ZEUS consistent

# Single Top Production

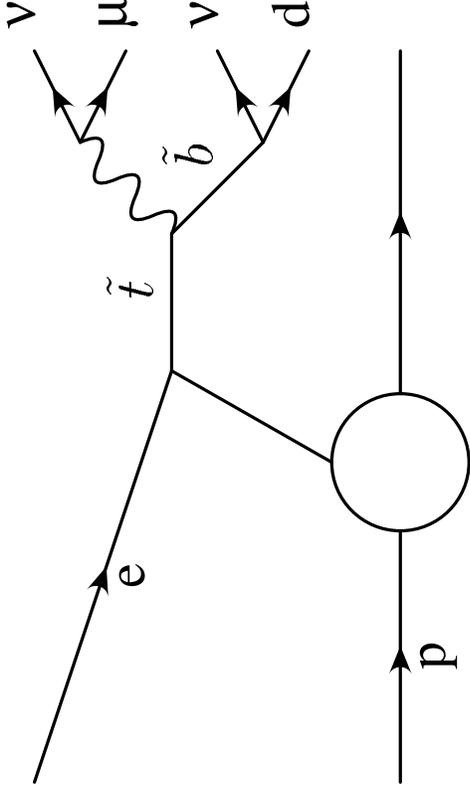

No signal found  
 $\Rightarrow$  setting limits on  
 FCNC photon coupling

# $R_p$ SUSY Processes

R-Parity:  $R_p = (-1)^{3B+L+2S}$

SM particles:  $R_p = +1$ , SUSY particles:  $R_p = -1$

$$\begin{aligned}
 W_{R_p} &= \lambda_{ijk} L_i L_j \bar{E}_k \quad (\text{LEP}) \\
 &+ \lambda'_{ijk} L_i Q_j \bar{D}_k \quad (\text{HERA}) \\
 &+ \lambda''_{ijk} \bar{U}_i \bar{U}_j \bar{D}_k \quad (\text{TeVatron})
 \end{aligned}$$

$L_i$  : left-handed lepton doublets

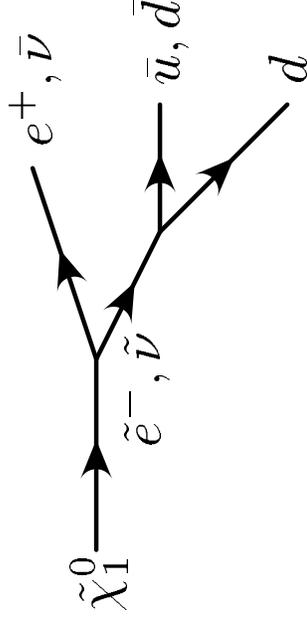

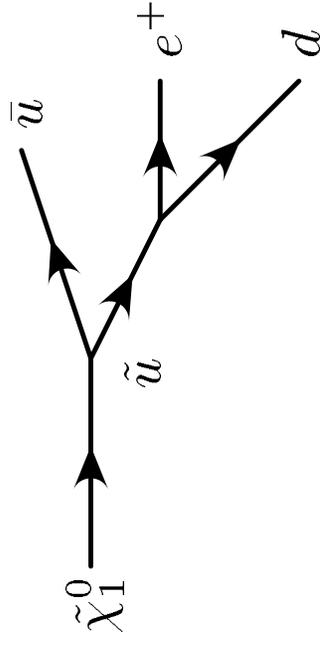

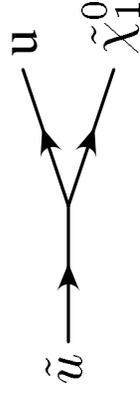

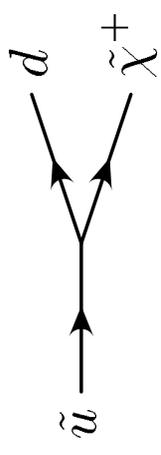

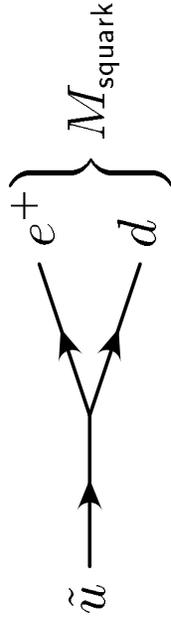

$Q_i$  : left-handed quark doublets

$\bar{E}$  : right-handed lepton singlets

$\bar{D}, \bar{U}$  : right-handed quark singlets

# $R_p$ SUSY Processes

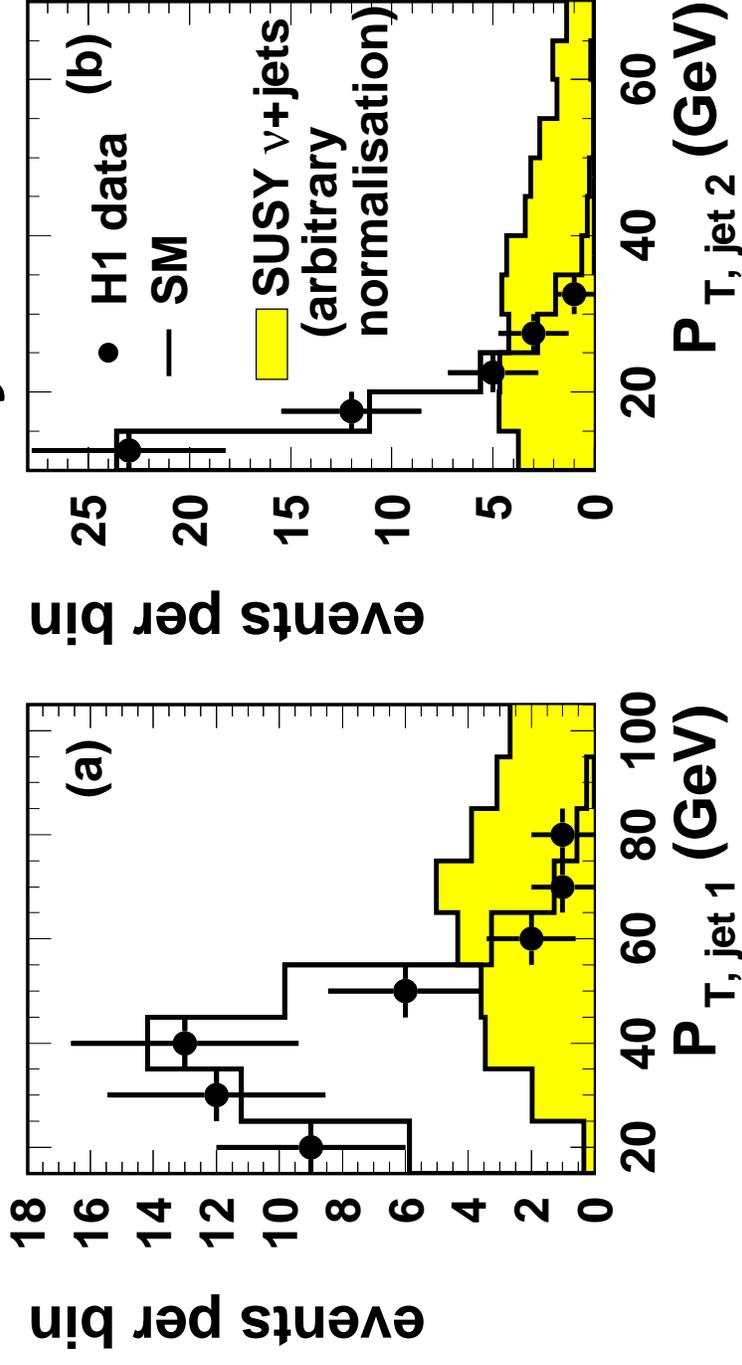

Looking at different decay channels:

...

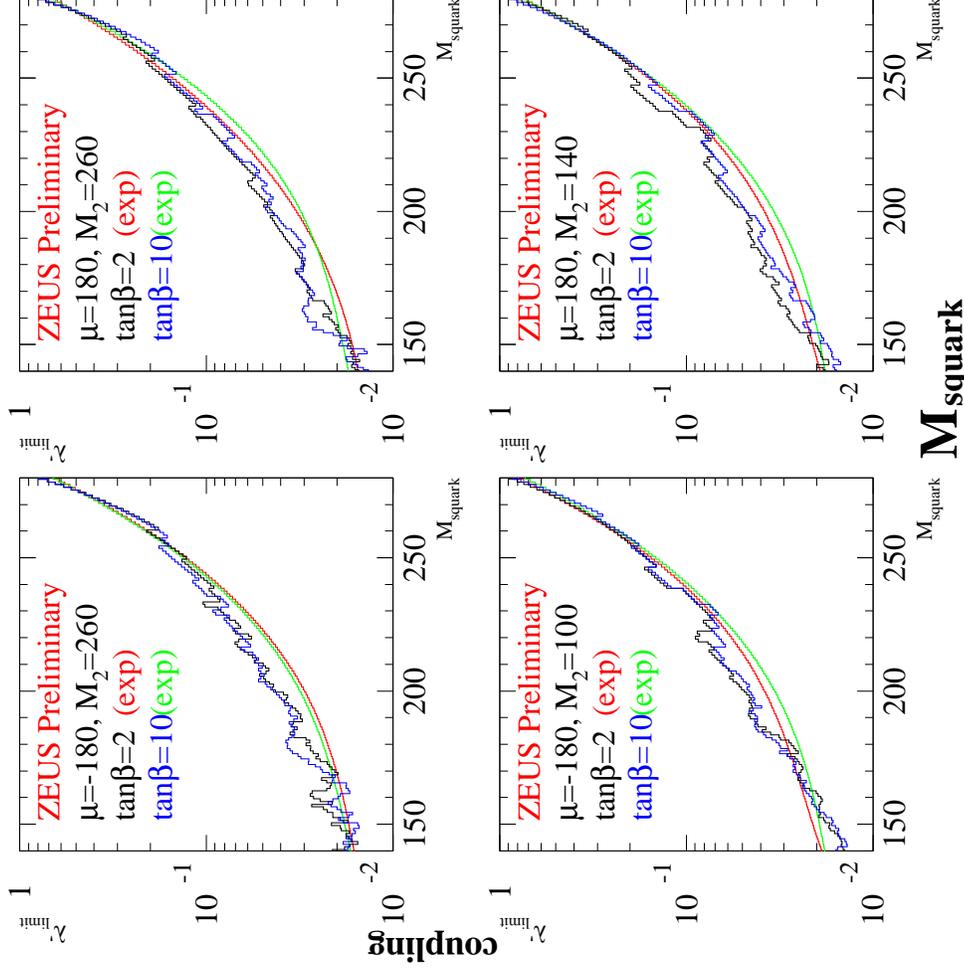

# $R_p$ SUSY Processes

## H1 Preliminary

One example channel :  $\nu$  + multiple jets

# $R_p$ SUSY Limits

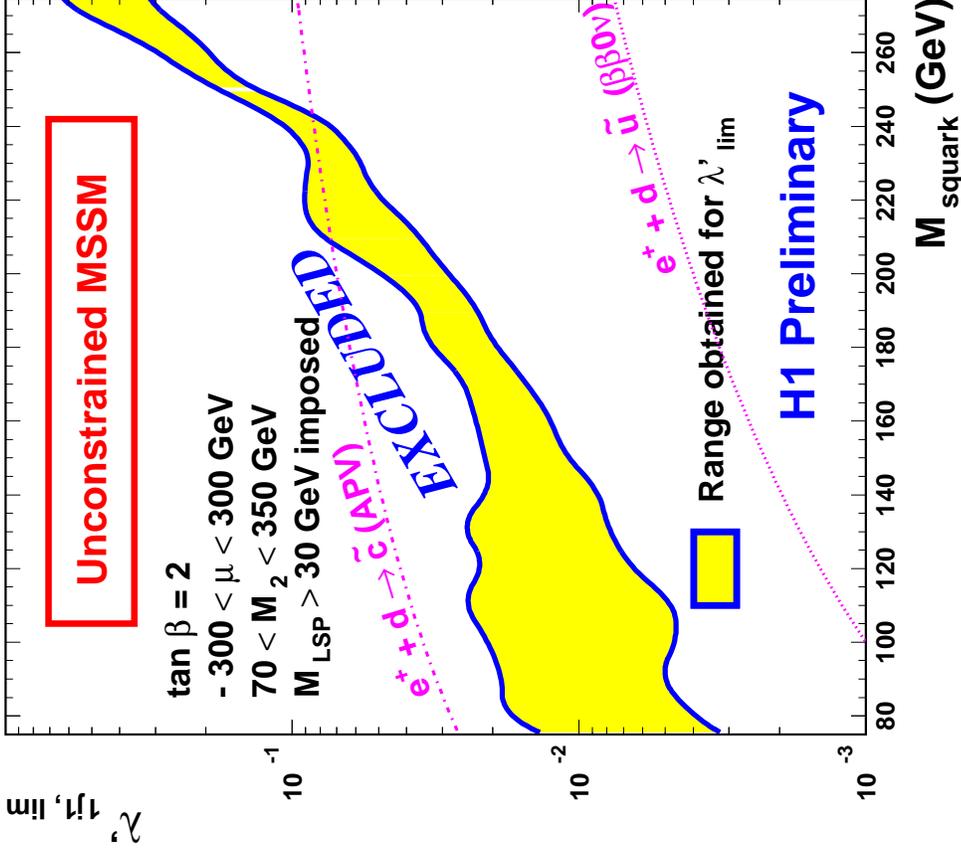

95% confidence level limit on  $\lambda'$   
observed (black, blue)  
expected (red, green)

plots show limits for different  
values for the parameters.

$\Rightarrow$  Limits nearly independent on  
choice of parameters.

# $R_p$ SUSY Limits

Scan through parameter region:  
 excluded region nearly  
 independent of parameter set.

$\beta\beta 0\nu$  (neutrino-less double beta decay)  
 sets limits on first generation  
 APV (atomic parity violation)  
 sets limits on second gen.

# Summary

## HERA

- Inclusive data well described by Standard Model
- Important testing ground for Beyond the Standard Model processes

## Results

- Limits on
  - +  $R_p$  SUSY
  - + Single Top production $\Rightarrow$  setting best limits available
- Excess of isolated lepton events @ H1 exciting
  - but not confirmed by ZEUS $\Rightarrow$  Only data after luminosity upgrade will resolve this puzzle
