Before I start

Multiple Apologies

I really know very little about the proton:

- mass = $1\text{GeV} = 1.67 \cdot 10^{-27}\text{ kg}$
- 3 valence quarks
- charge = +1
- spin = $1/2 \rightarrow \text{Spin}$
- radius $\approx 1\text{ fm}$; shape?
- lifetime » age of the universe
- afflicted by QCD

I have no real explanation for any of this!

And I am sorry, if I should disturb you doing your Email or reading your favorite newspaper.

DISCLAIMER

**I will not try to be complete
on any subject.**

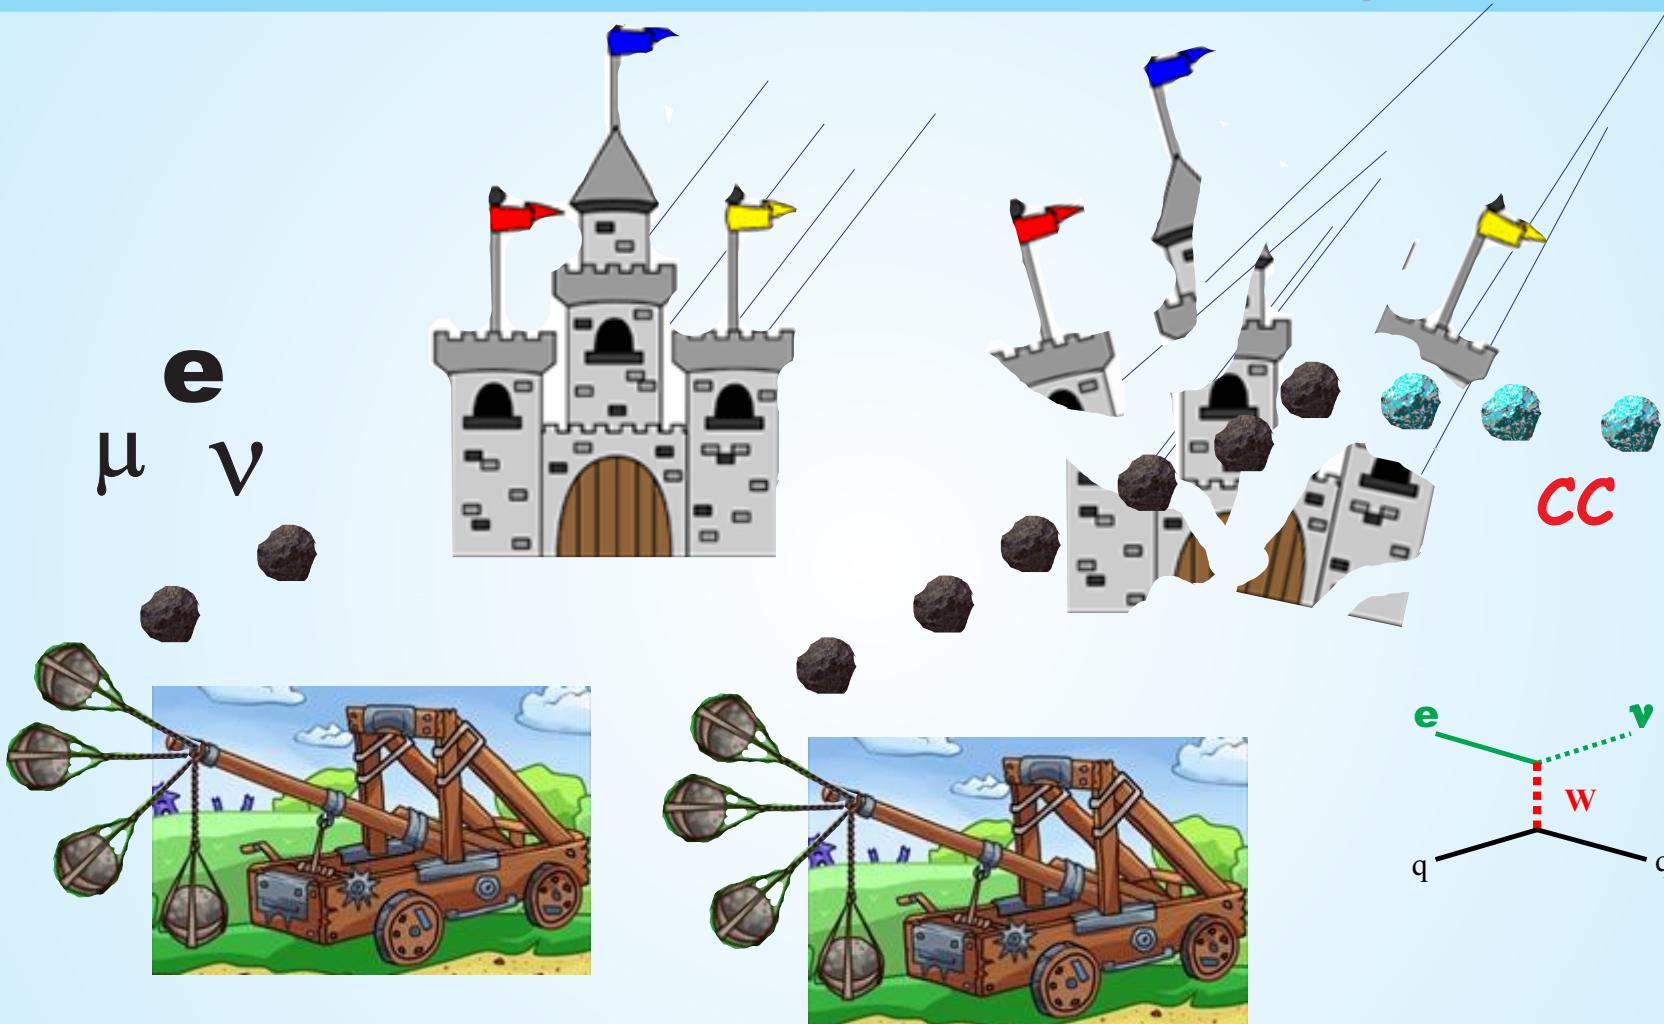

**I have selected what I saw fit
to make my point.**

**Any opinion is only mine and is
in no way supported by either
ZEUS or H1 or probably anybody else.**

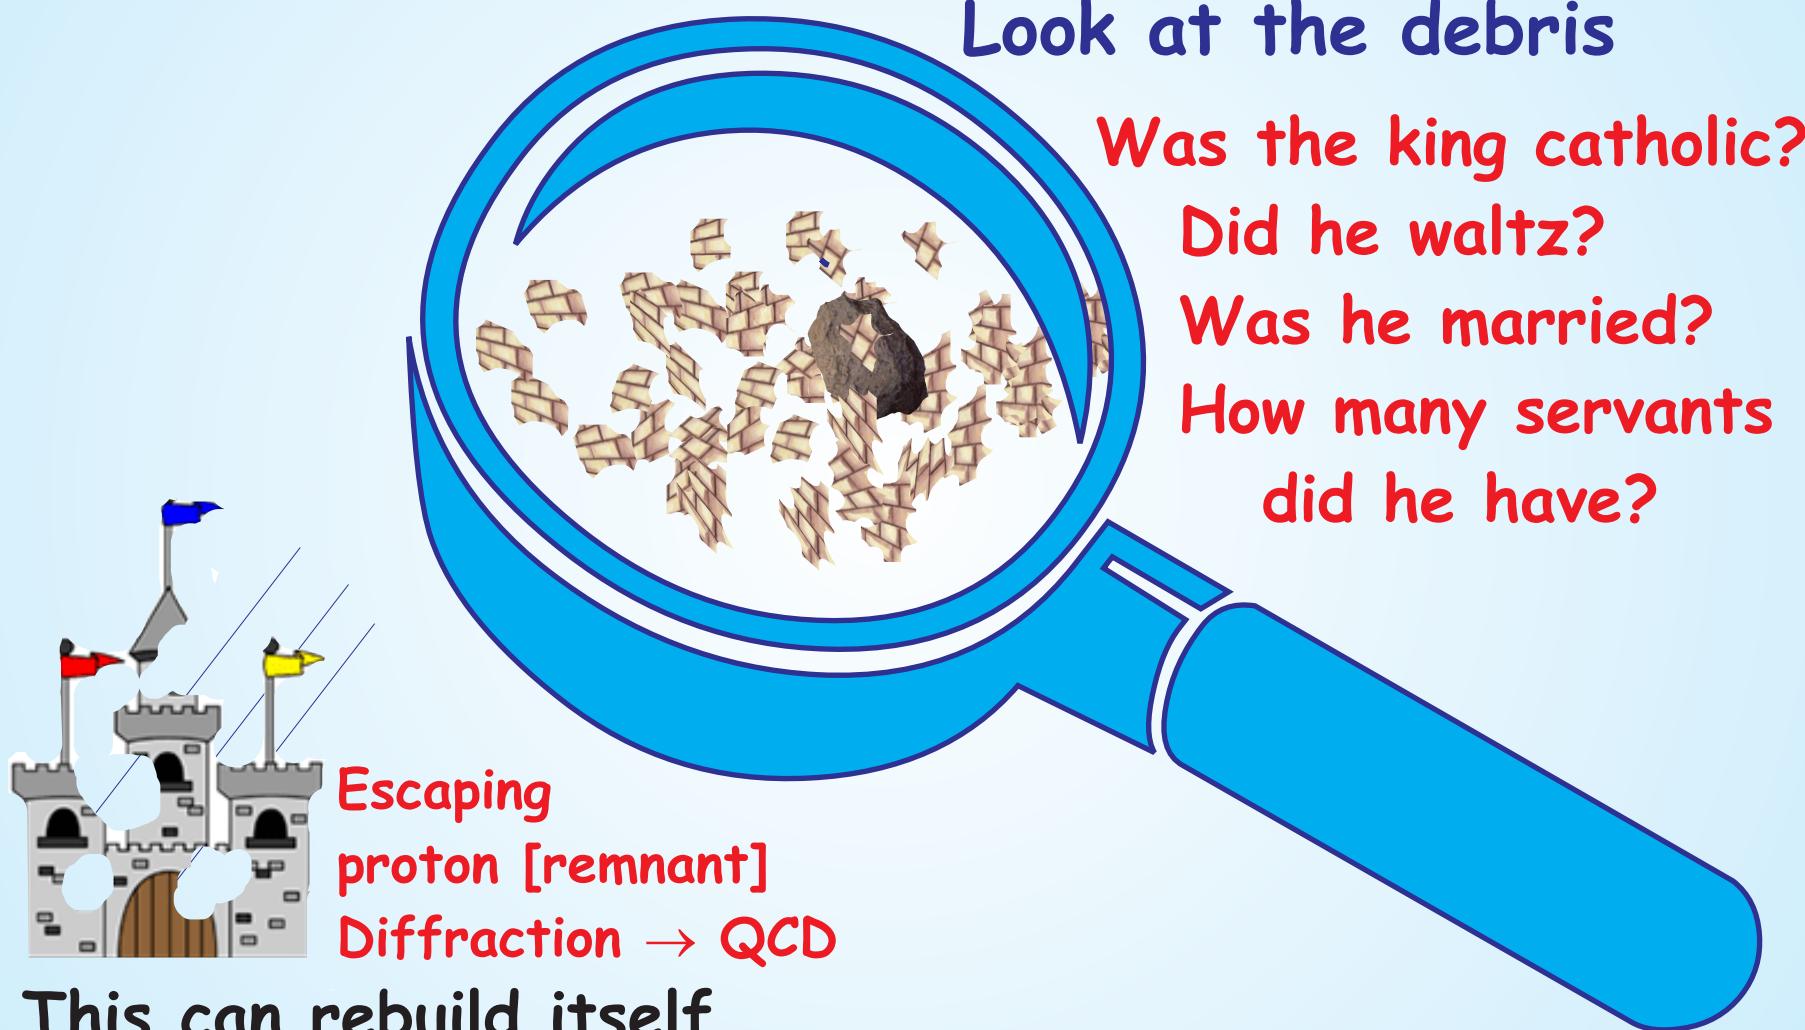

**Nevertheless I am proud to represent
H1 and ZEUS.**

Deep Inelastic Scattering

Deep Inelastic Scattering

Look at the debris

Was the king catholic?
Did he waltz?
Was he married?
How many servants
did he have?

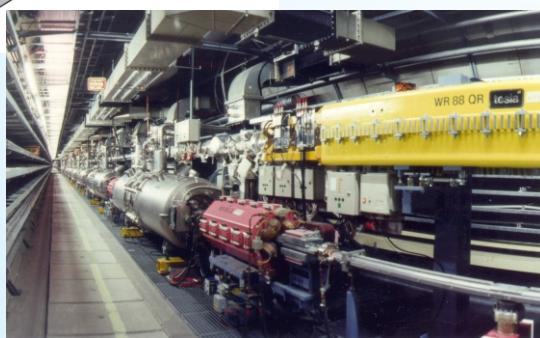

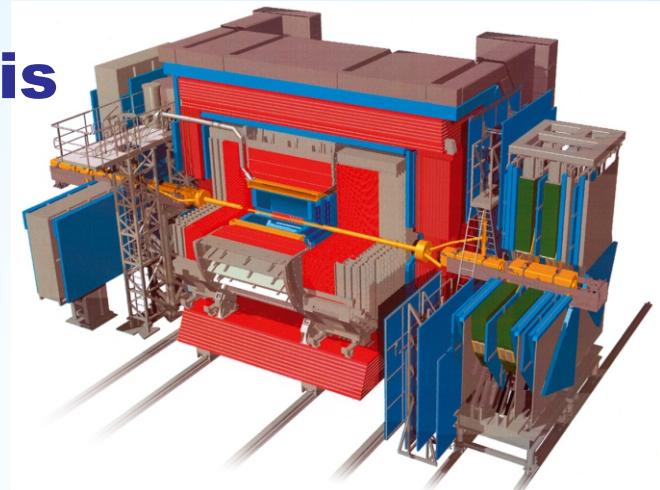

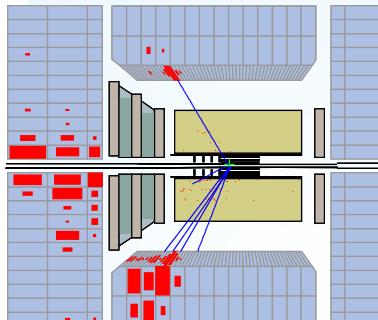

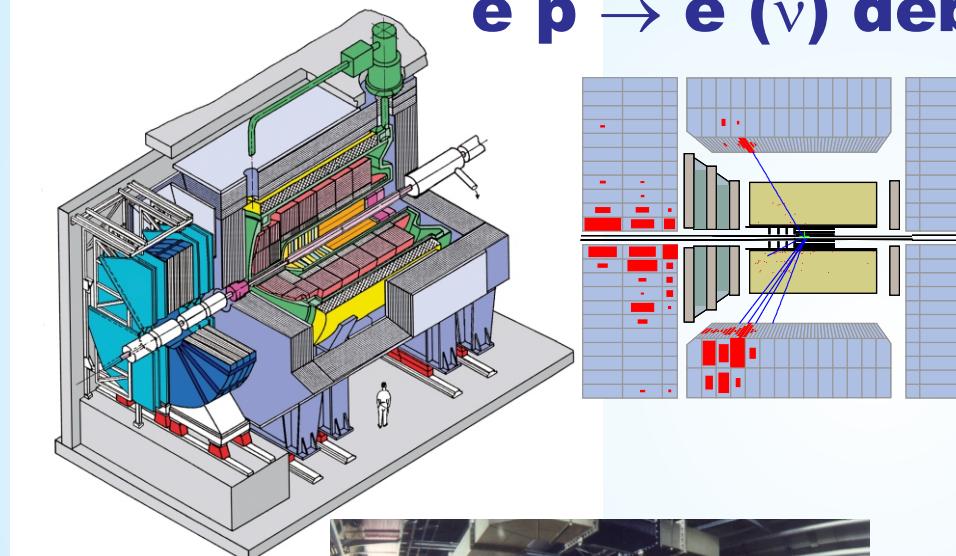

Escaping
proton [remnant]
Diffraction → QCD

This can rebuild itself

The Microscope

That is what we measure!

$e^- p \rightarrow e^- (\nu) \text{ debris}$

**We sort events,
classify, count,
plot and interpret.**

→ **kinematic
variables**

Kinematics

Virtuality

$$Q^2 = -(k - k')^2$$

Spatial resolution of probe

$$\lambda \sim 1/\sqrt{Q^2}$$

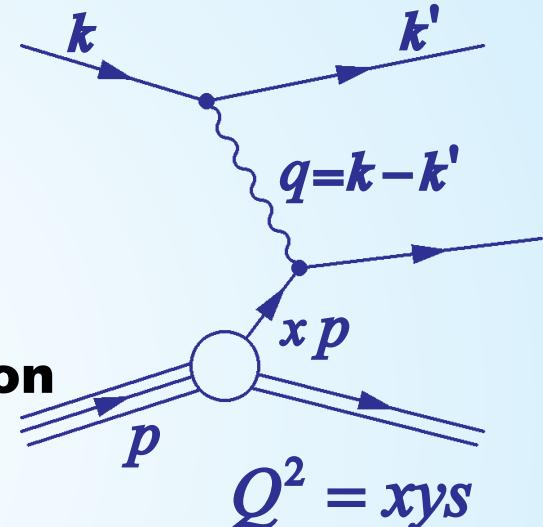

Bjorken scaling variable:

$$x = Q^2 / 2pq$$

Momentum fraction of struck parton

Inelasticity: $y = pk / pq$

Energy transfer to proton (in p rest frame)

Reconstruction

$$y_e = 1 - \frac{E'_e(1 - \cos \theta_e)}{2E_e}$$

$$Q_e^2 = \frac{{E'_e}^2 \sin^2 \theta_e}{1 - y_e}$$

$$x_e = \frac{Q_e^2}{4E_p E_e y_e}$$

Factorisation

Decompose cross section:

$$\sigma(ep \rightarrow e + H + X) = \sum_{j,j' = q,\bar{q},g} f_{j/p}(x, Q) \otimes \hat{\sigma}_{jj'}(x, Q, z) \otimes F_{H/j'}(z, Q)$$

parton distribution functions **PDF** partonic cross section **hadronisation**

NC $V^* = \gamma^*, Z^*$

Born $V^* q \rightarrow q$

boson-gluon-fusion $V^* g \rightarrow q\bar{q}$

QCD-Compton-scattering $V^* q \rightarrow qg$

CC W^*

$V^* q \rightarrow q'$

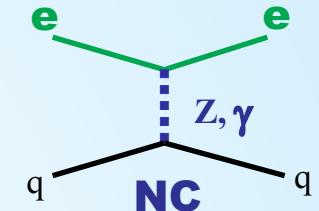

lowest-order QCD

Structure Functions

$e^\pm p$

tree level

$$\sigma_{r,NC}^\pm = \frac{d^2\sigma_{NC}^{e^\pm p}}{dx dQ^2} \cdot \frac{Q^4 x}{2\pi\alpha^2 Y_+} = \tilde{F}_2 \mp \frac{Y_-}{Y_+} x \tilde{F}_3 - \frac{y^2}{Y_+} \tilde{F}_L$$

$$\tilde{F}_2 = F_2 - \kappa_Z v_e \cdot F_2^{\gamma Z} + \kappa_Z^2 (v_e^2 + a_e^2) \cdot F_2^Z$$

$$Y_\pm = 1 \pm (1-y)^2$$

$$\tilde{F}_L = F_L - \kappa_Z v_e \cdot F_L^{\gamma Z} + \kappa_Z^2 (v_e^2 + a_e^2) \cdot F_L^Z$$

v_e vector
 a_e axial-vector eZ weak couplings

$$x \tilde{F}_3 = \kappa_Z a_e \cdot x F_3^{\gamma Z} - \kappa_Z^2 \cdot 2 v_e a_e \cdot x F_3^Z$$

$$\kappa_Z(Q^2) = Q^2 / [(Q^2 + M_Z^2)(4 \sin^2 \theta_W \cos^2 \theta_W)]$$

(2)

QPM $\tilde{F}_L = 0$

$$(F_2, F_2^{\gamma Z}, F_2^Z) = [(e_u^2, 2e_u v_u, v_u^2 + a_u^2)(xU + x\bar{U}) + (e_d^2, 2e_d v_d, v_d^2 + a_d^2)(xD + x\bar{D})]$$

$$(xF_3^{\gamma Z}, xF_3^Z) = 2[(e_u a_u, v_u a_u)(xU - x\bar{U}) + (e_d a_d, v_d a_d)(xD - x\bar{D})]$$

$$xU = xu + xc \quad x\bar{U} = x\bar{u} + x\bar{c} \quad xD = xd + xs \quad x\bar{D} = x\bar{d} + x\bar{s}$$

sea quarks = anti-quarks
valence quark distributions

$$xu_v = xU - x\bar{U}$$

$$xd_v = xD - x\bar{D}$$

Structure Functions

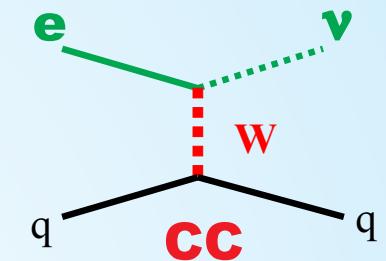

$e^\pm p$

tree level

QPM $W_L^\pm = 0$

$$\sigma_{r,CC}^\pm = \frac{Y_+}{2} W_2^\pm \mp \frac{Y_-}{2} x W_3^\pm - \frac{y^2}{2} W_L^\pm$$

CC is unfortunately
a bit more difficult.

$$W_2^+ = x\bar{U} + xD \quad xW_3^+ = xD - x\bar{U} \quad W_2^- = xU + x\bar{D} \quad xW_3^- = xU - x\bar{D}$$

$$\sigma_{r,CC}^+ = x\bar{U} + (1-y)^2 xD \quad \sigma_{r,CC}^- = xU + (1-y)^2 x\bar{D}$$

NC and CC yield valence and sea quark distribution.

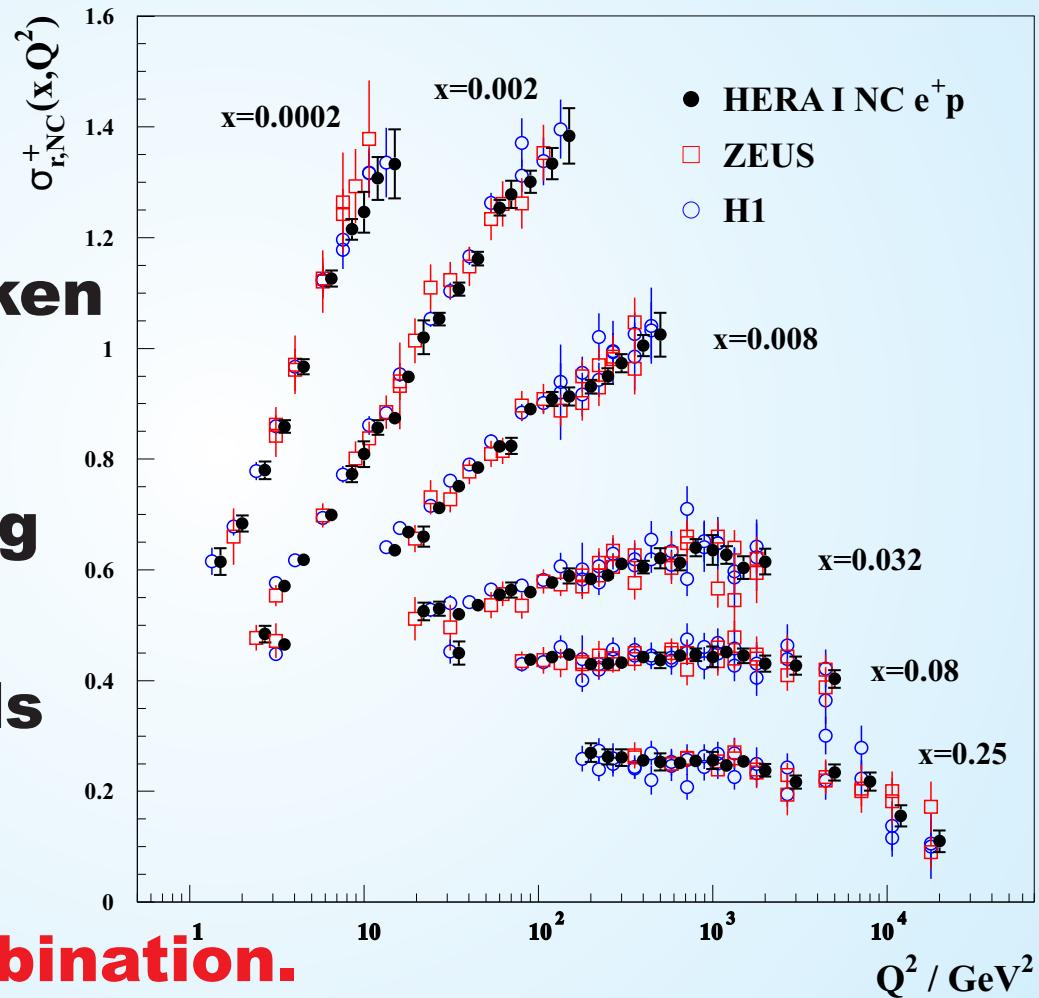

QCD analysis [DGLAP] yields gluon distribution.

Advent of Precision

**2010:
H1 and ZEUS
publish combined
results on data taken
1993 to 2000.**

**10 years of fighting
to understand
detectors, methods
and systematics.**

H1 and ZEUS

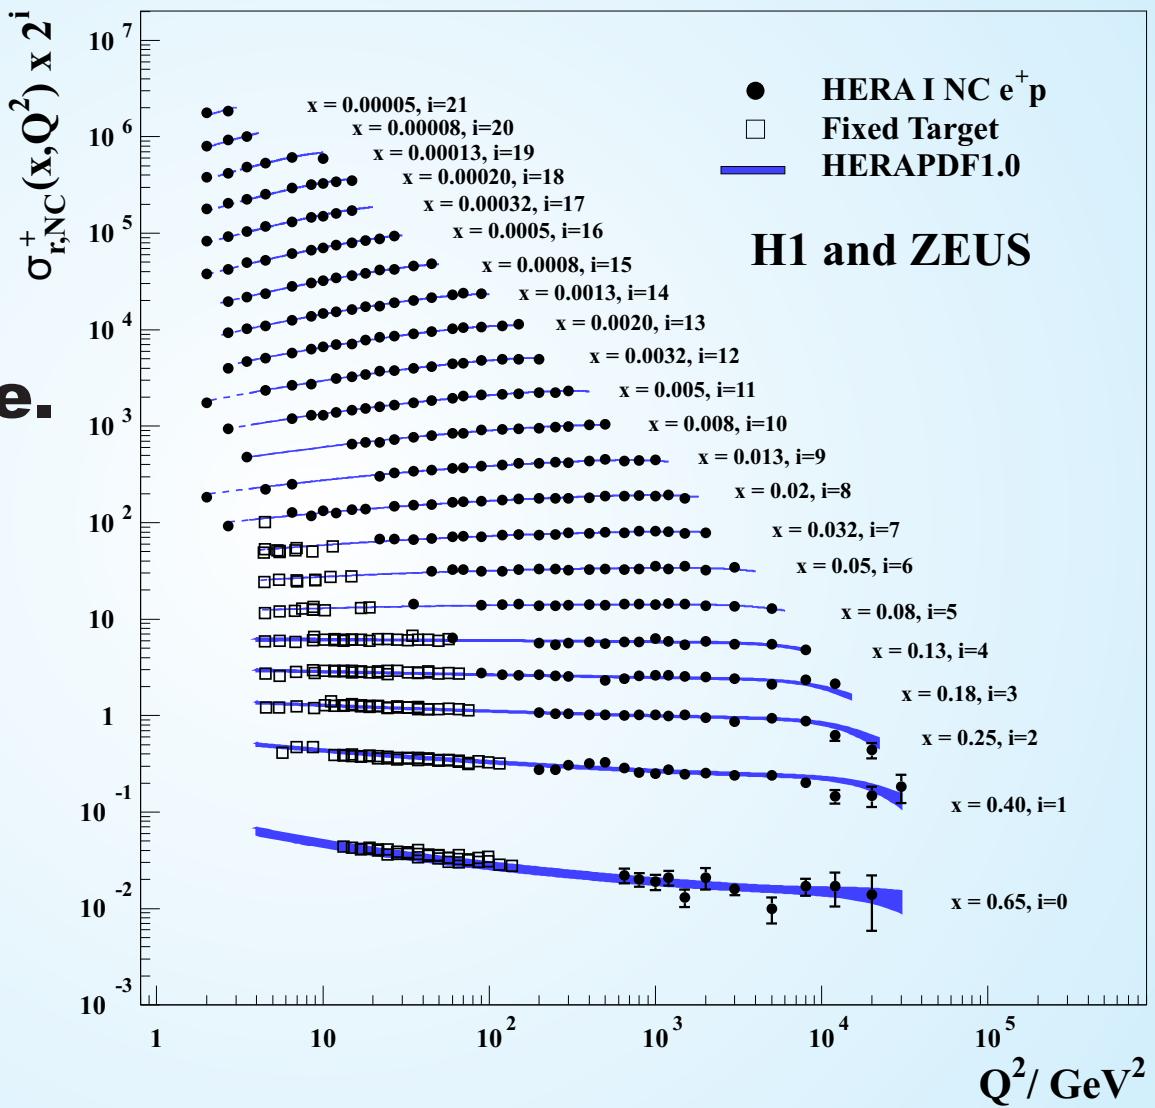

The power of combination.

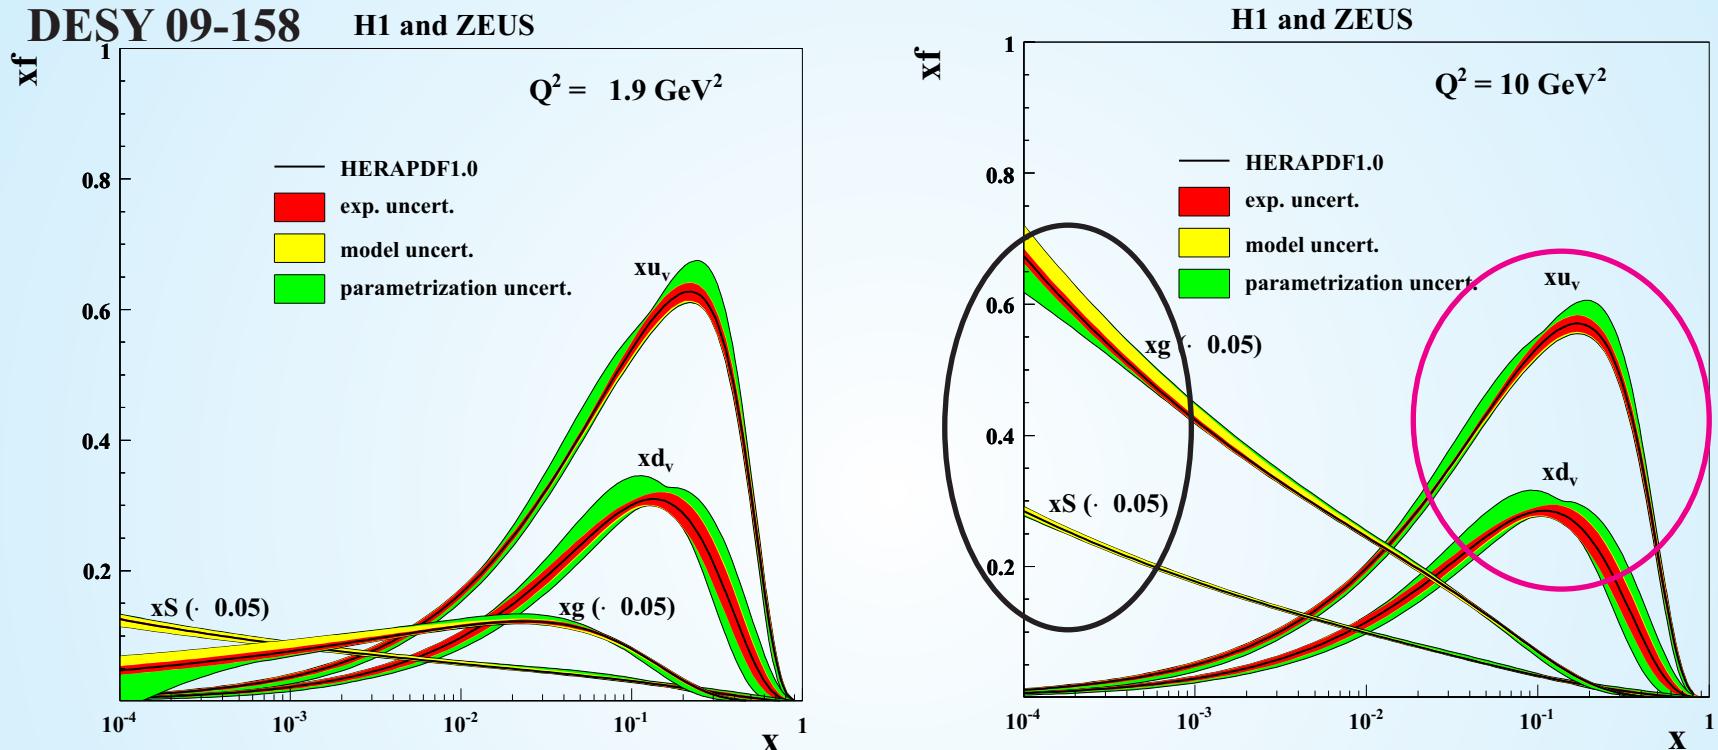

Reduced Cross Section

Cross section
data over a
very large
kinematic range.

HERA data
were used as
only input
to fit
HERAPDF 1.0

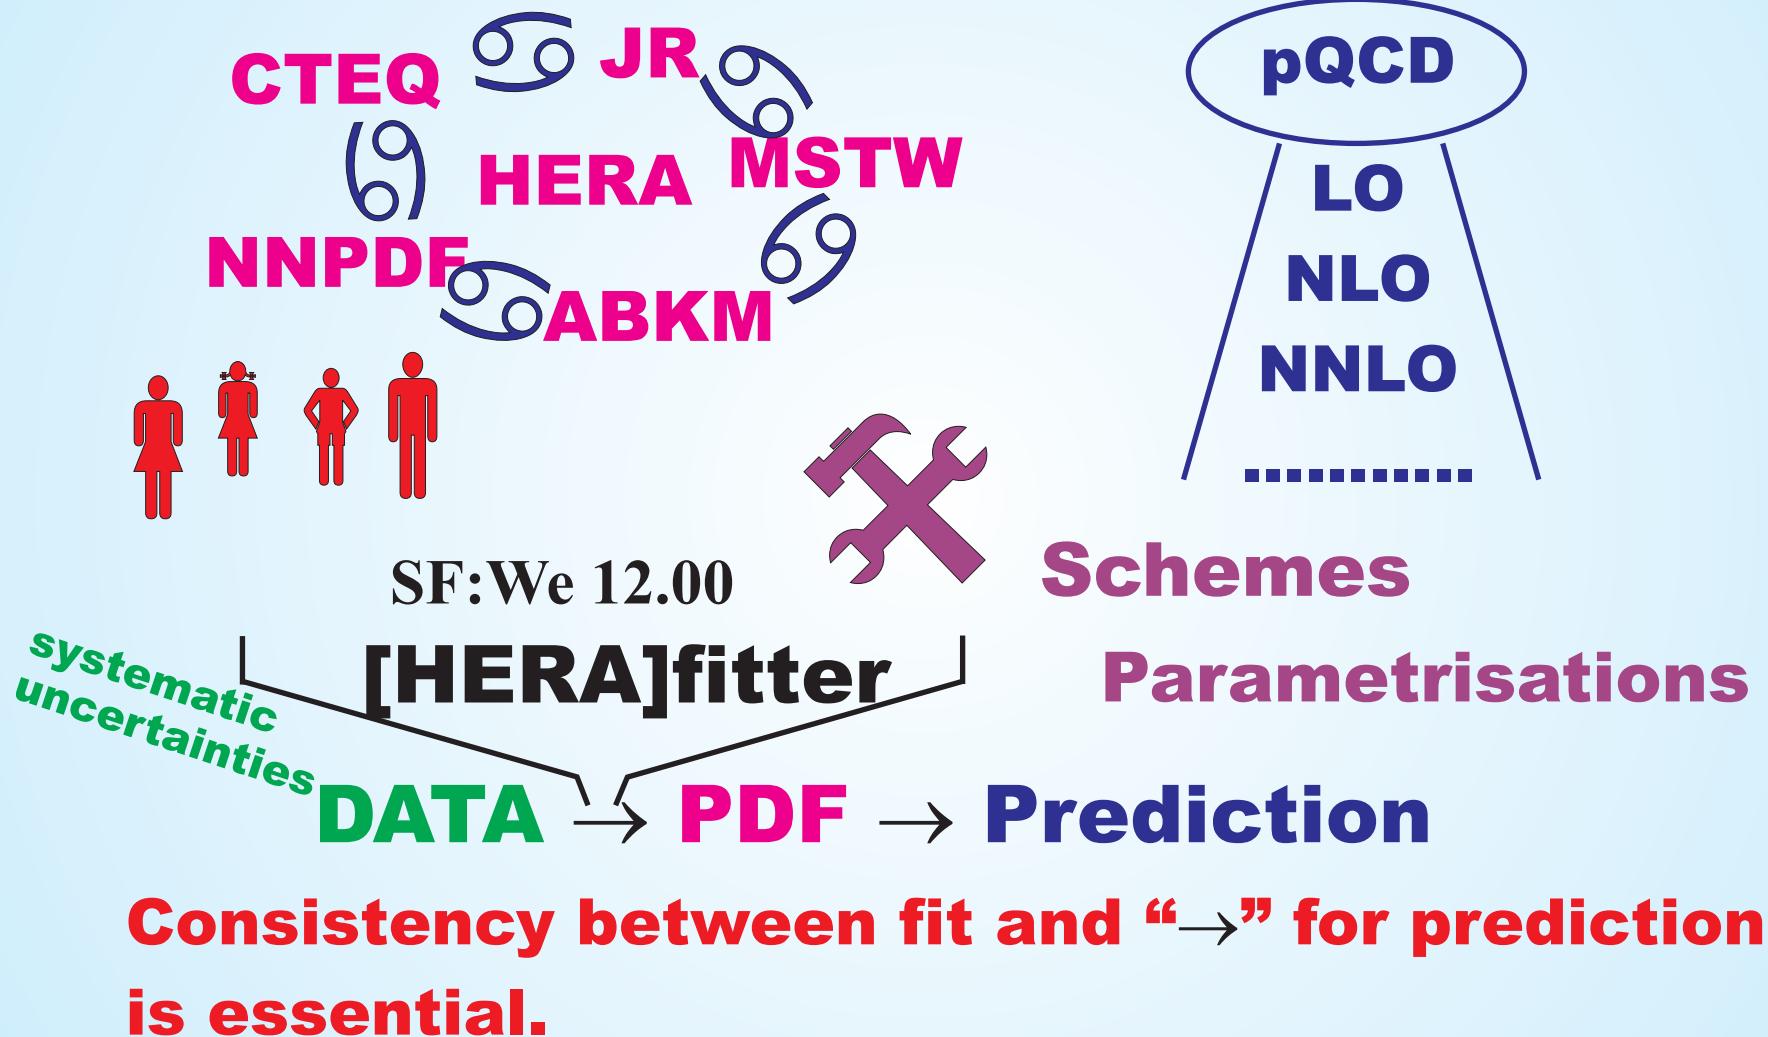

HERAPDF1.0

The proton pdfs reveal the valence quarks plus glue and sea evolving with Q^2 .
Inclusive DIS data alone can do this.

Beautiful Destruction

HERAPDF Predictions

LHC needs PDFs to predict SM distributions

No reliable PDFs
⇒ no reliable searches

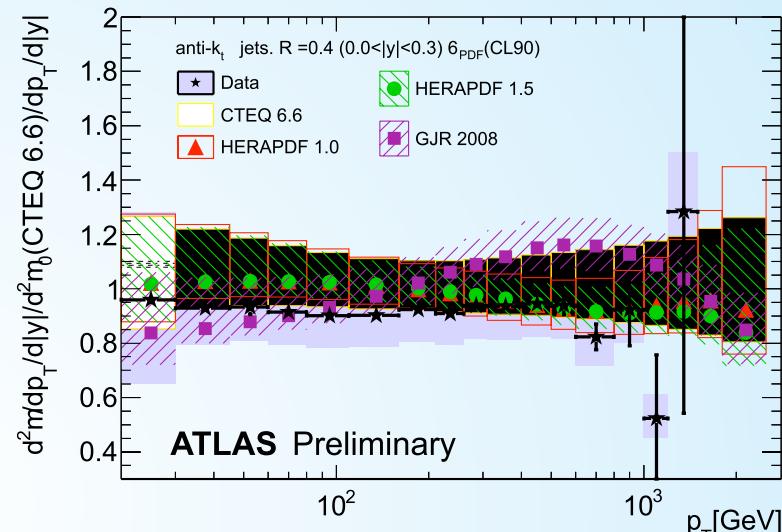

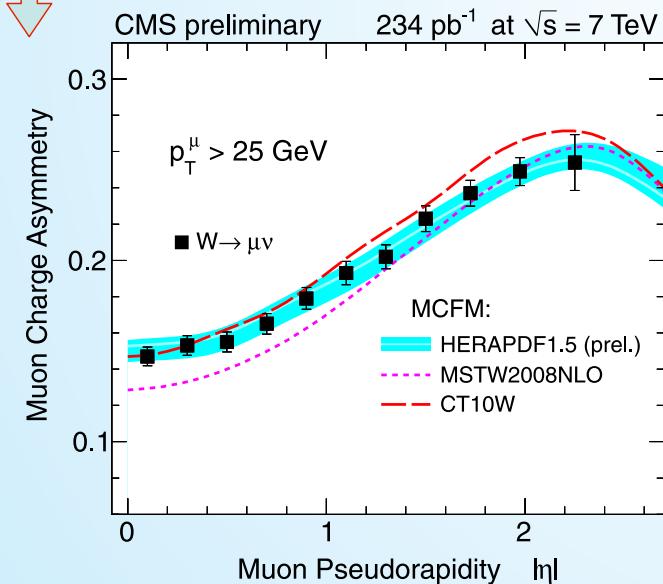

HERAPDF used by ATLAS and CMS

Jet production measurement:
sensitive to gluon distribution, $\alpha_s(M_Z)$

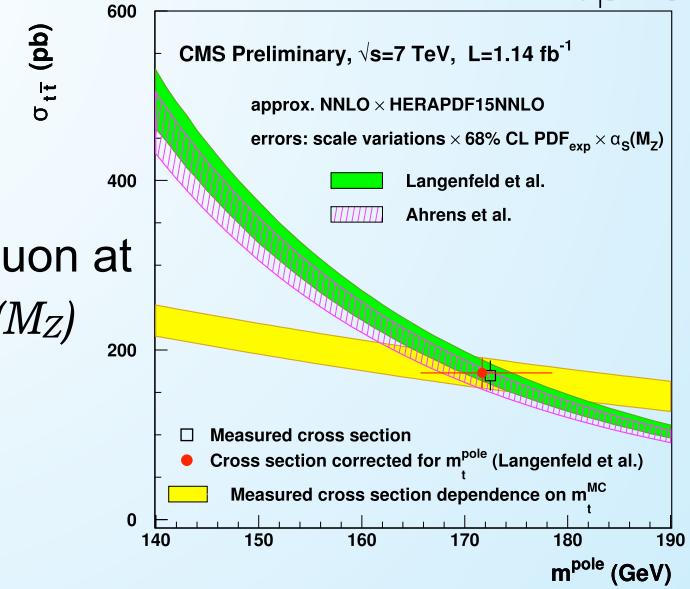

W muon charge asymmetry:
sensitive to difference between u and d

$$A_W = \frac{W^+ - W^-}{W^+ + W^-} \approx \frac{u_v - d_v}{u_v + d_v + 2u_{\text{sea}}}$$

Top pair production:

sensitive to gluon at high x , $\alpha_s(M_Z)$

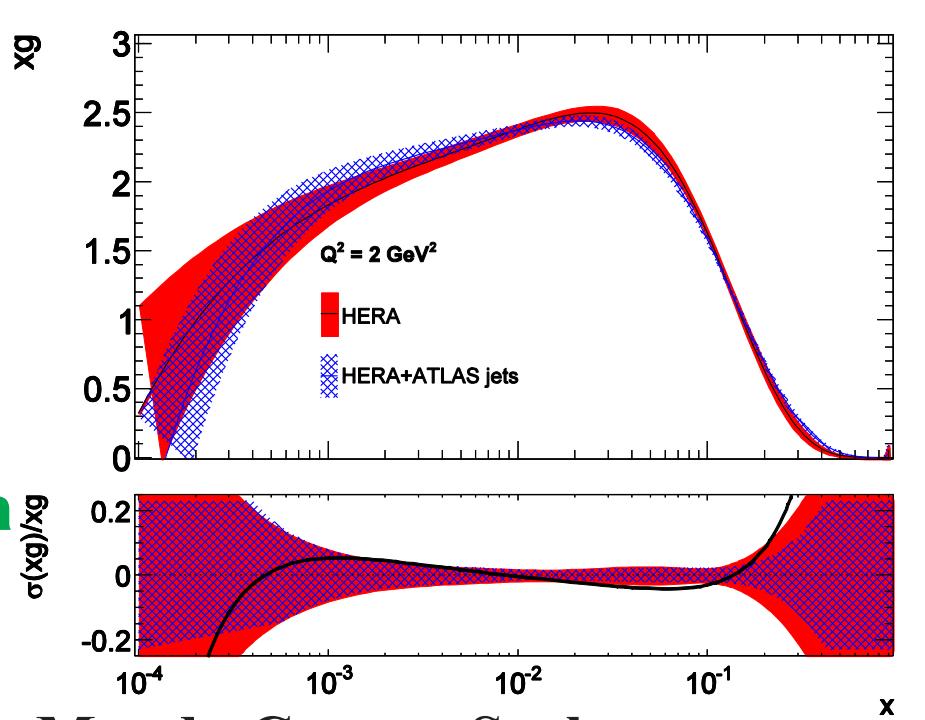

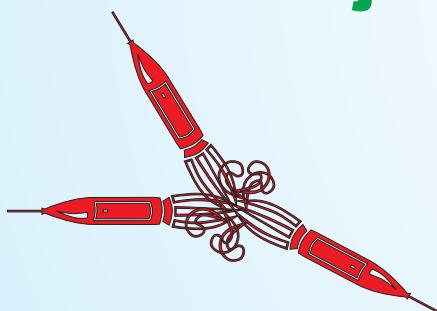

LHC can contribute

HERAPDF 1.5f

plus ATLAS jet data

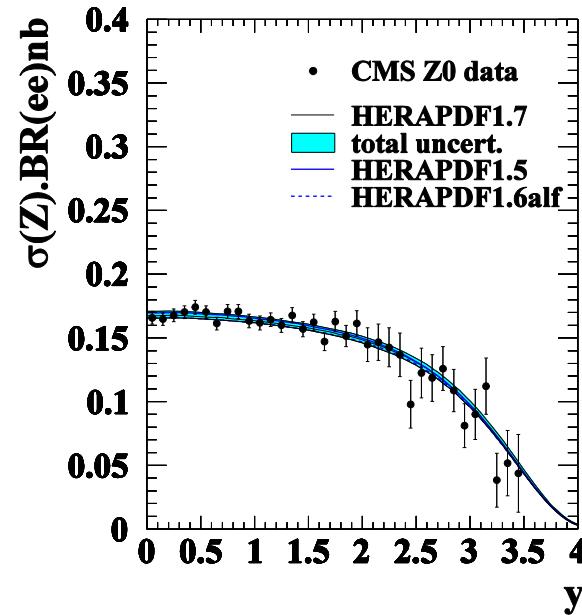

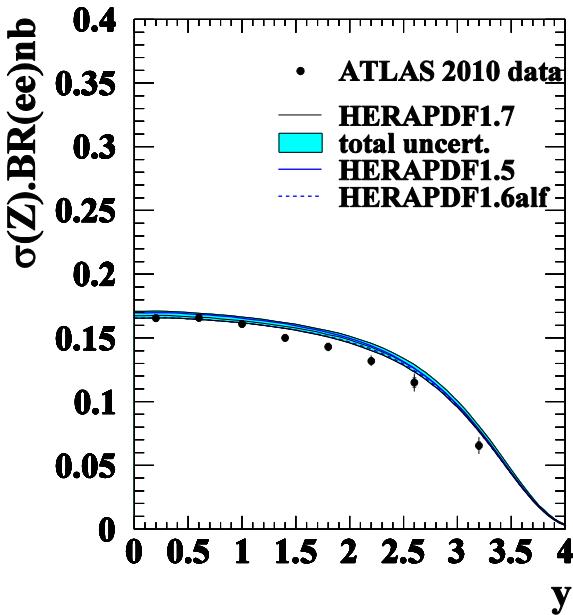

Mandy Cooper-Sarkar
Work done on published ATLAS data

**ATLAS jets would like high- x gluon to be harder.
HERA also still has jet data.** DESY 12-045 HFS: Tu 17.50

HERAPDF Predictions

Z° production at the LHC

Private communication from Mandy Cooper-Sarkar

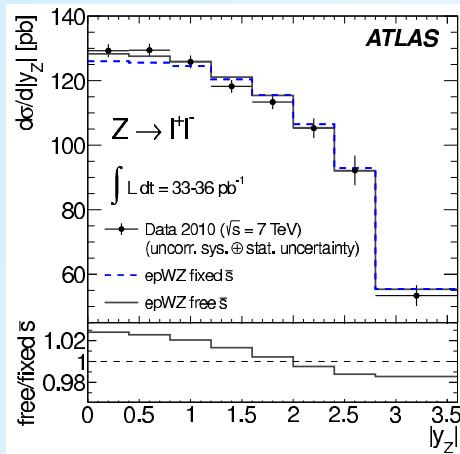

HERAPDF 1.7 is doing quite well.

The differences to HERAPDF1.5/1.6 are small.

The strange sea is so far restricted in HERAPDF.

LHC can contribute

Strangeness

$$r_s = 1.00 \pm 0.20^{\text{exp}} \\ \pm 0.07^{\text{mod}} {}^{+0.10}_{-0.15} {}^{+0.06}_{-0.07} \alpha_s \\ \pm 0.08^{\text{th.}}$$

SF: Tu 9.40

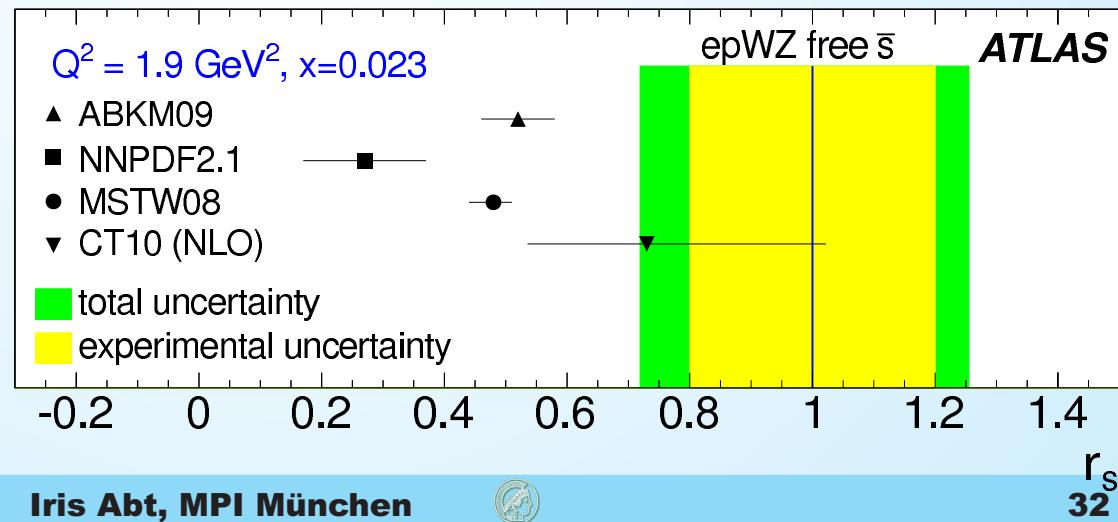

strange quark would need
CC analysis of Ds at HERA
.... mission impossible

ATLAS measures rapidity distribution of Z° production

$$\text{Fit } r_s = 0.5(s + \bar{s})/\bar{d} \quad x\bar{s}(x) = A_s x^{B_{\bar{d}}} (1 - x)^{C_s}$$

HERAfitter

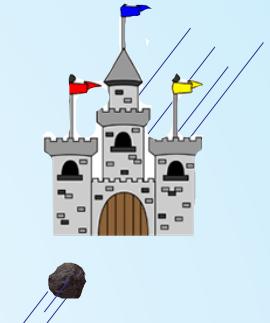

arxiv:1203.4051

Longitudinal Structure Function

F_L is a high y phenomenon:

$$\sigma_r(x, Q^2) = F_2(x, Q^2) - \frac{y^2}{1 + (1 - y)^2} F_L(x, Q^2)$$

Need cross section for varying y at fixed x and Q^2

$Q^2 = xys \Rightarrow$ need to change s

$E_p = 920 \text{ GeV}$ $E_p = 575 \text{ GeV}$ $E_p = 460 \text{ GeV}$

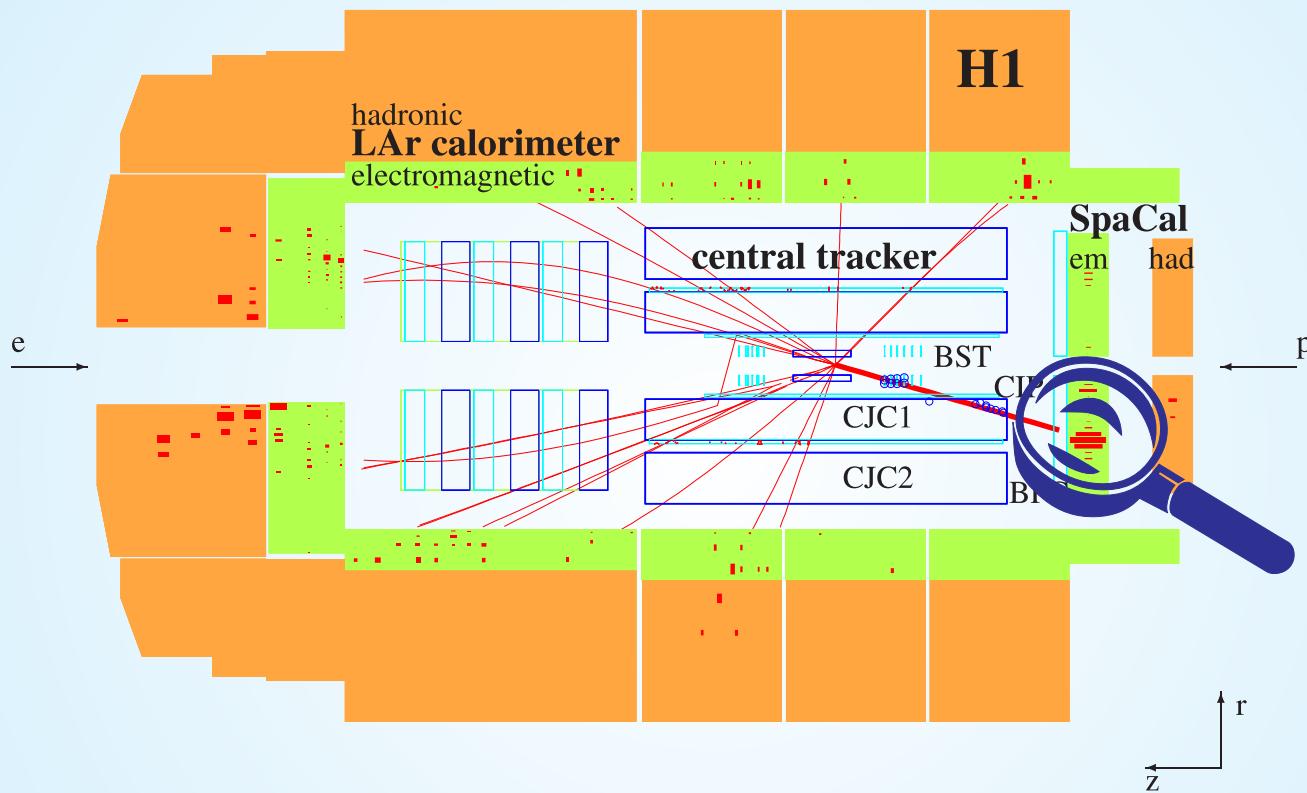

Low Q^2 and high $y \Rightarrow$ low energy of scattered electron

This is a challenge!

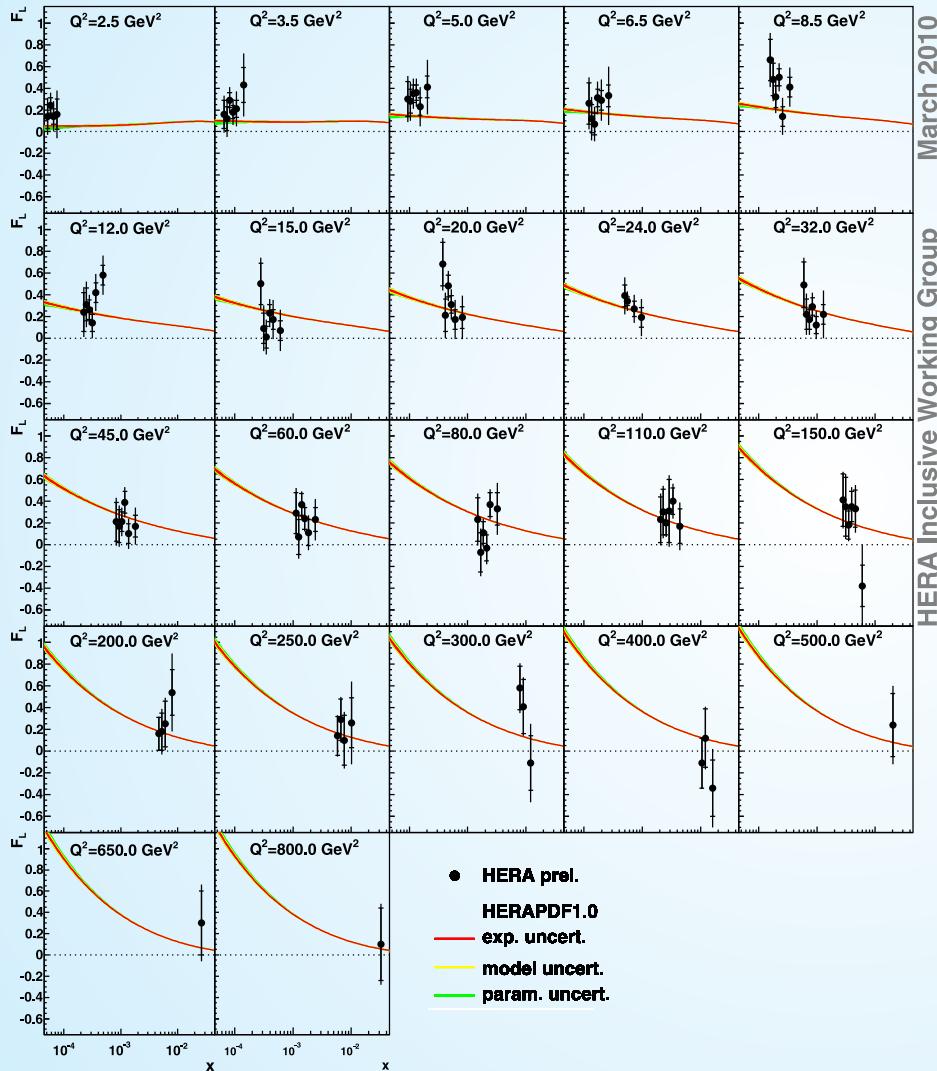

Direct access to glue!

Longitudinal Structure Function

**Events down to electron energies of 3.4 GeV
for ZEUS 6.0 GeV**

Longitudinal Structure Function

March 2010
HERA Inclusive Working Group

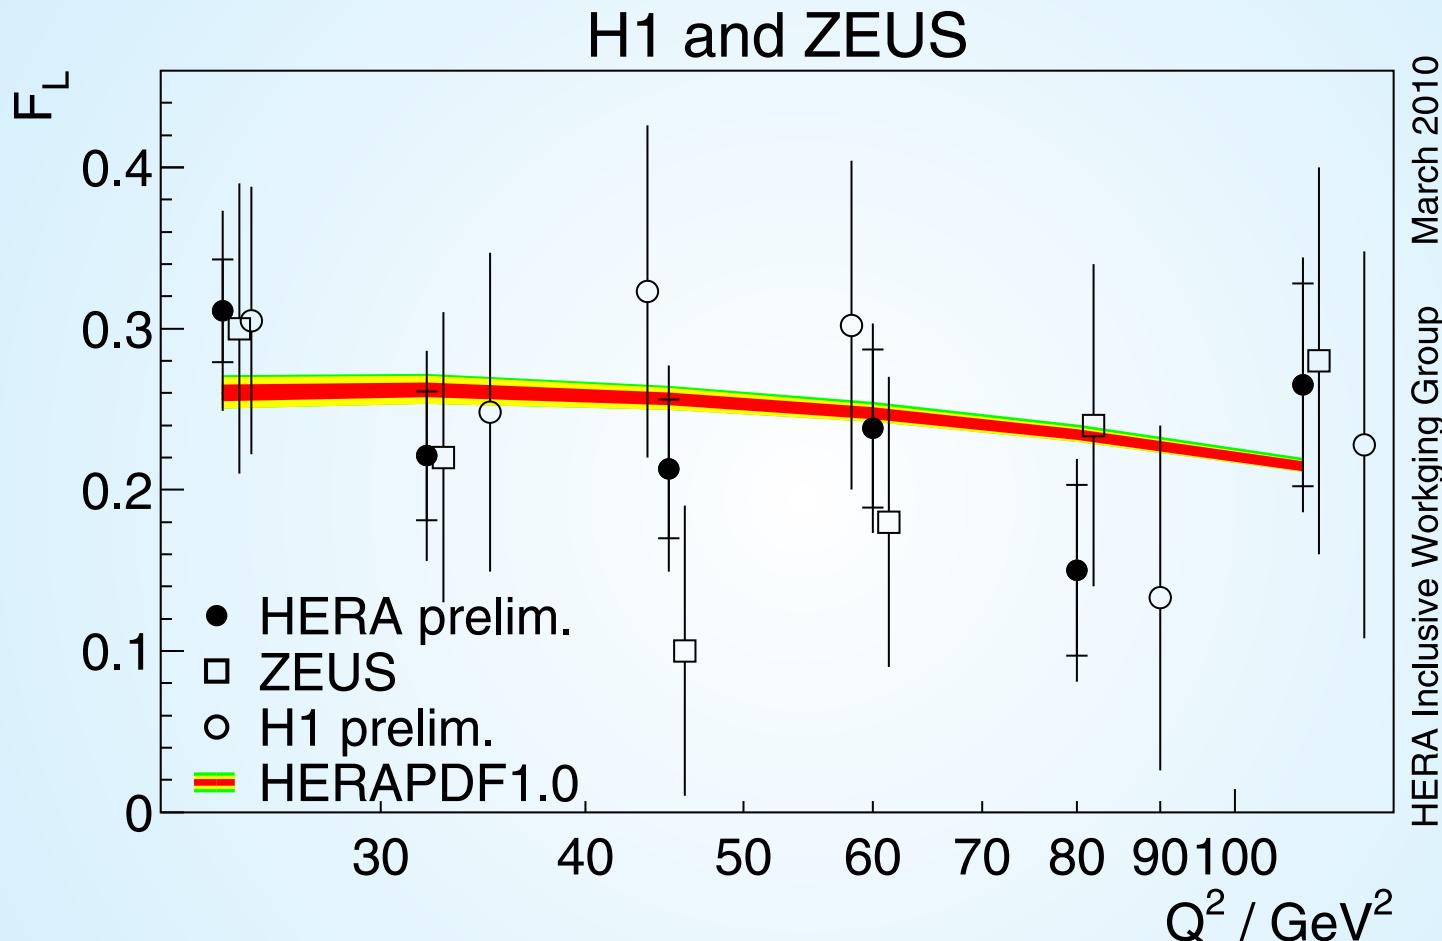

**H1 and ZEUS
combined**

**wide range
of Q^2 and down
to $x \approx 0.00003$**

**Fixed Target
could only access
high x region,
where F_L is small.**

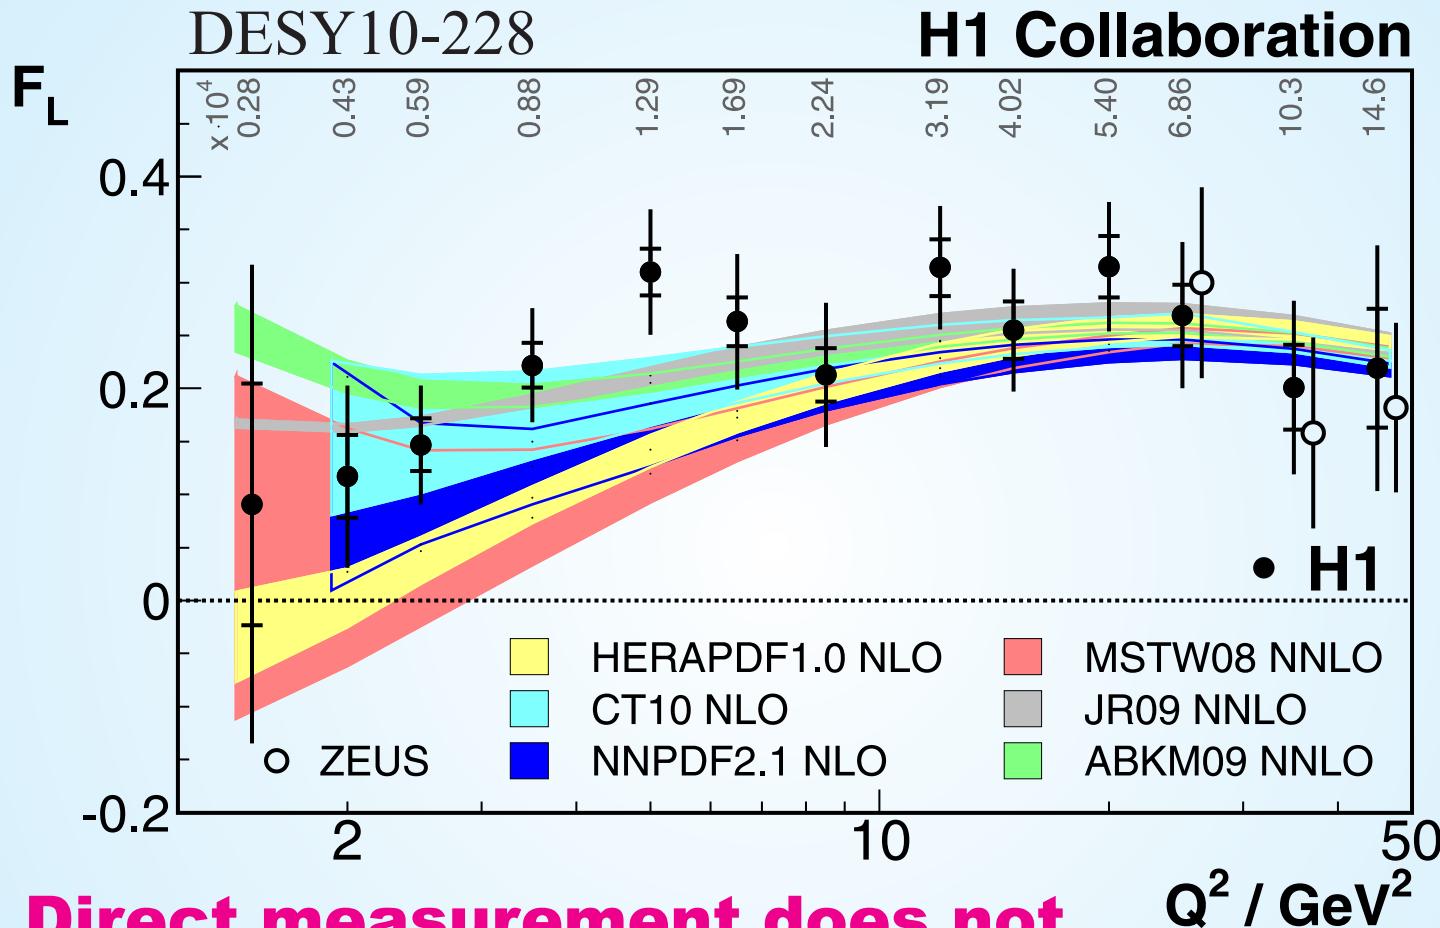

Longitudinal Structure Function

It is not zero.

Longitudinal Structure Function

Direct measurement does not contradict PDF predictions.

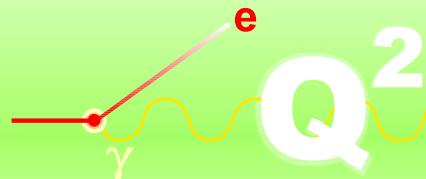

But there is something else.

Low x Partons in the Proton ?

Heisenberg is strictly against it !

**That x is a fraction of the proton momentum
is only an interpretation.**

DESY: B.Liebaug

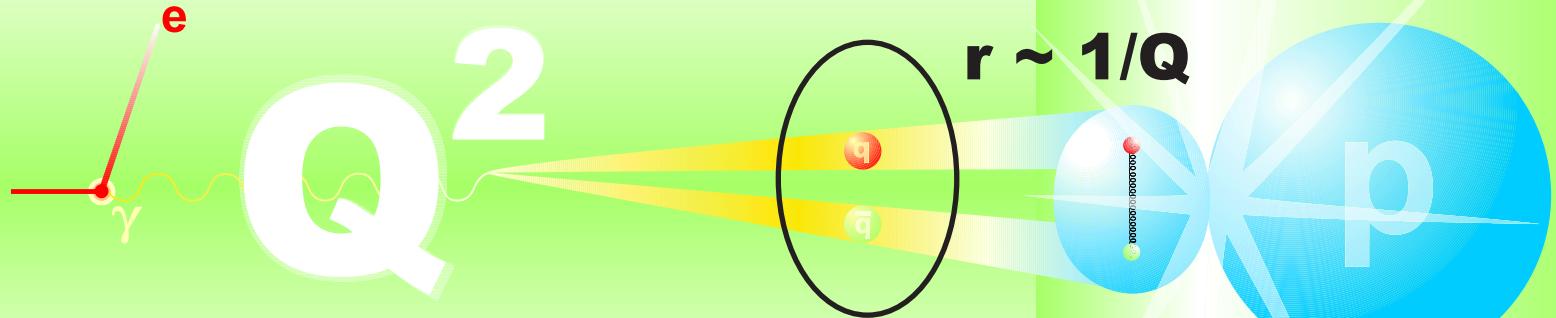

**Fluctuations
in the photon can grow.
For low Q^2 they live long and prosper.**

**Its a parton distribution, but not necessarily
in the proton. Has the parametrisation a meaning?**

Color Dipole Model

Coherence length: $\lambda [fm] \approx 0.1/x$

DESY: B.Liebaug

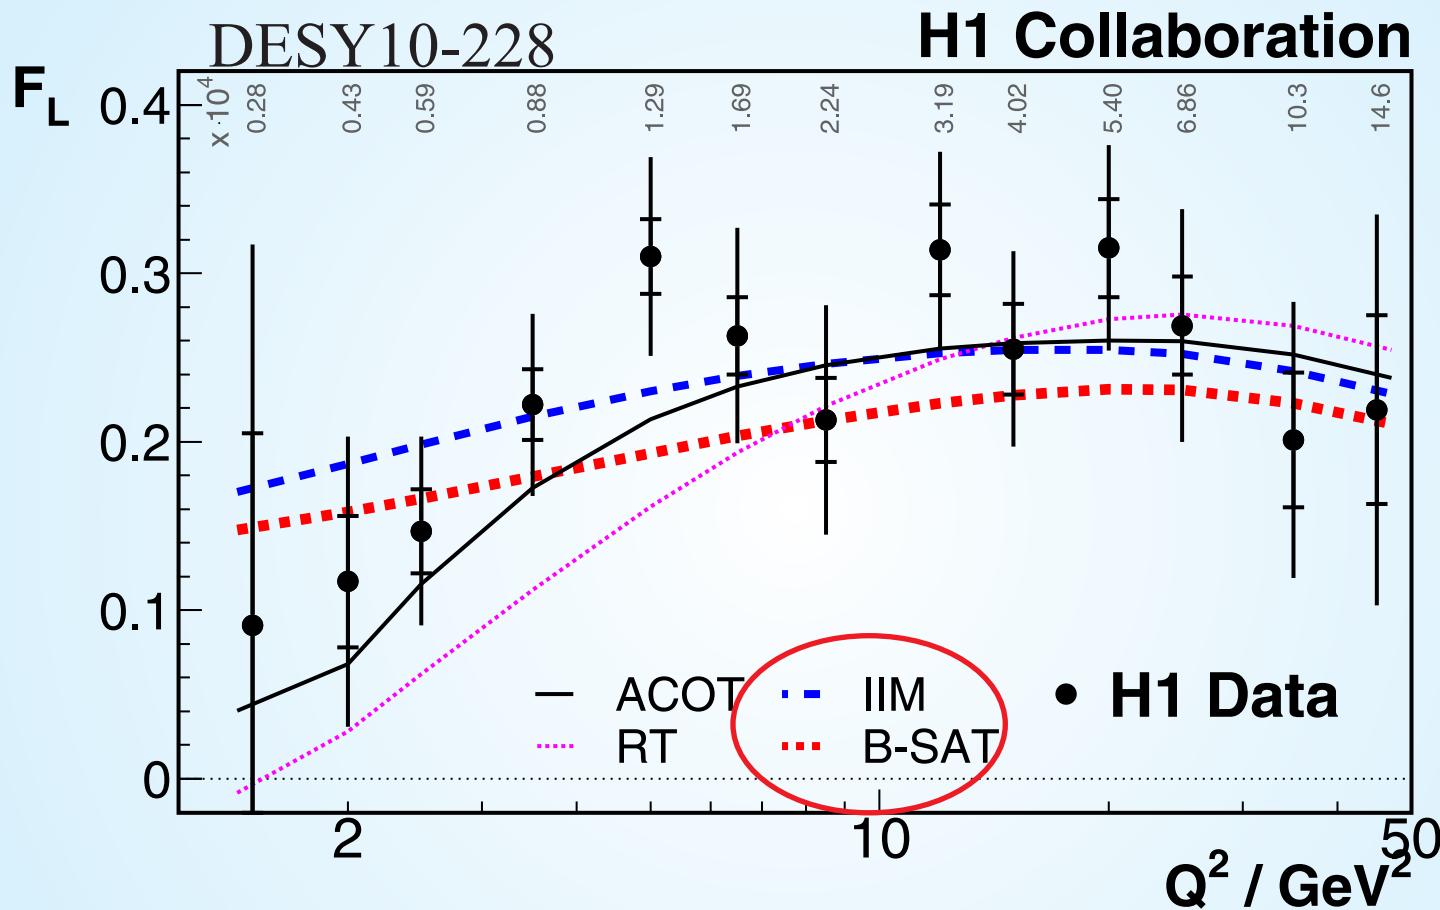

For high Q^2 only a color dipole forms.
No time for more.

The fluctuation might forget where it came from.
Do I get the same PDFs for neutrino - nucleon or
nucleon nucleon scattering? Is factorisation holding?

SF: Tu 16.30

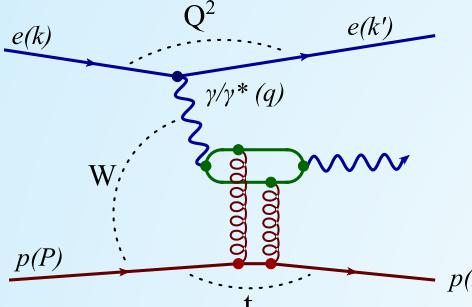

Longitudinal Structure Function

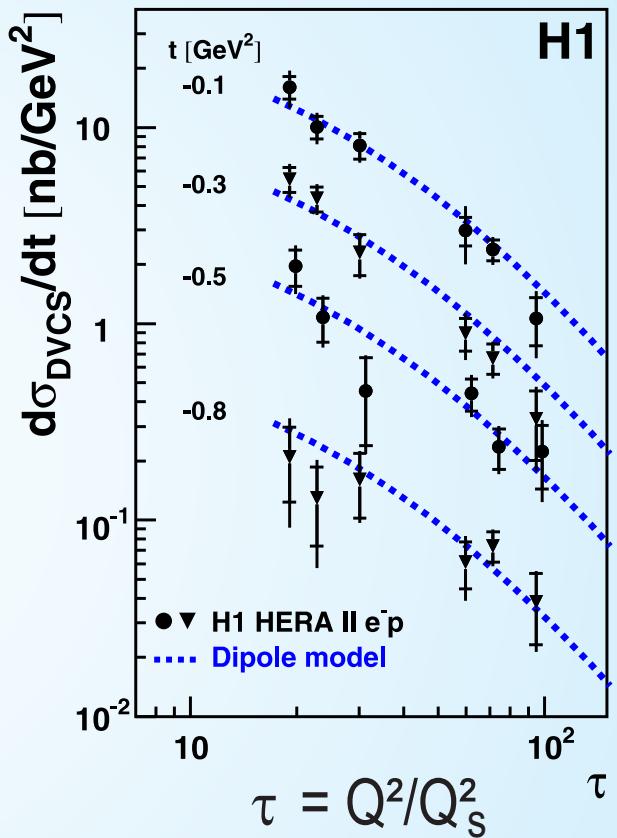

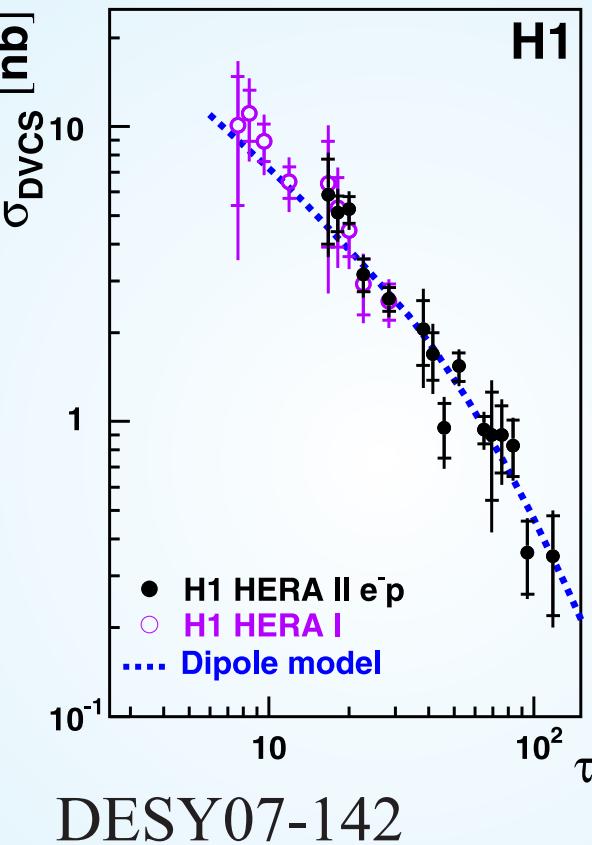

Color dipole models also describe the data.

SF: Tu 16.45

Deeply Virtual Compton Scattering

**t-dependence
of the
cross section
is also of
interest.**

The dipole model does well.

Deeply Virtual Compton Scattering

**Generalised parton distribution functions
are used for two gluons.**

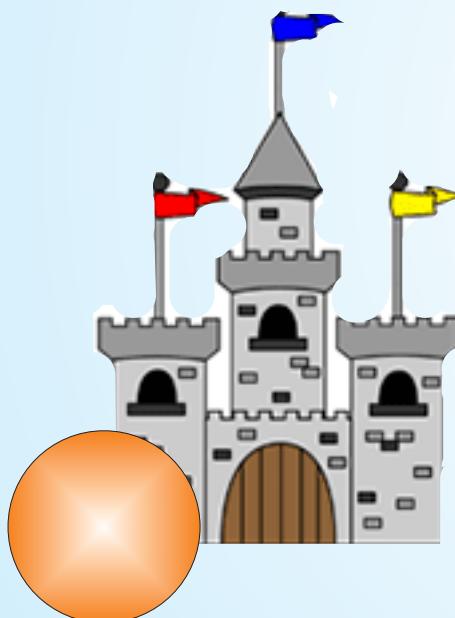

**Interpretation in longitudinal momentum space
and transverse position space**

$$d\sigma/dt \sim \exp(-b|t|)$$

$$\begin{array}{c} b = 5.45 \pm 0.19 \pm 0.34 \text{ /GeV}^2 \\ \longrightarrow \qquad \qquad \qquad \text{DESY07-142} \end{array}$$

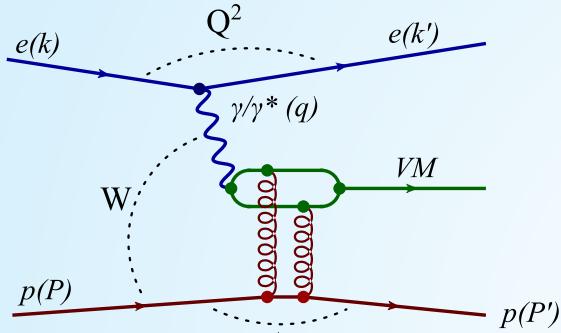

average impact parameter

$0.65 \pm 0.02 \text{ fm}$ $x=0.0012$

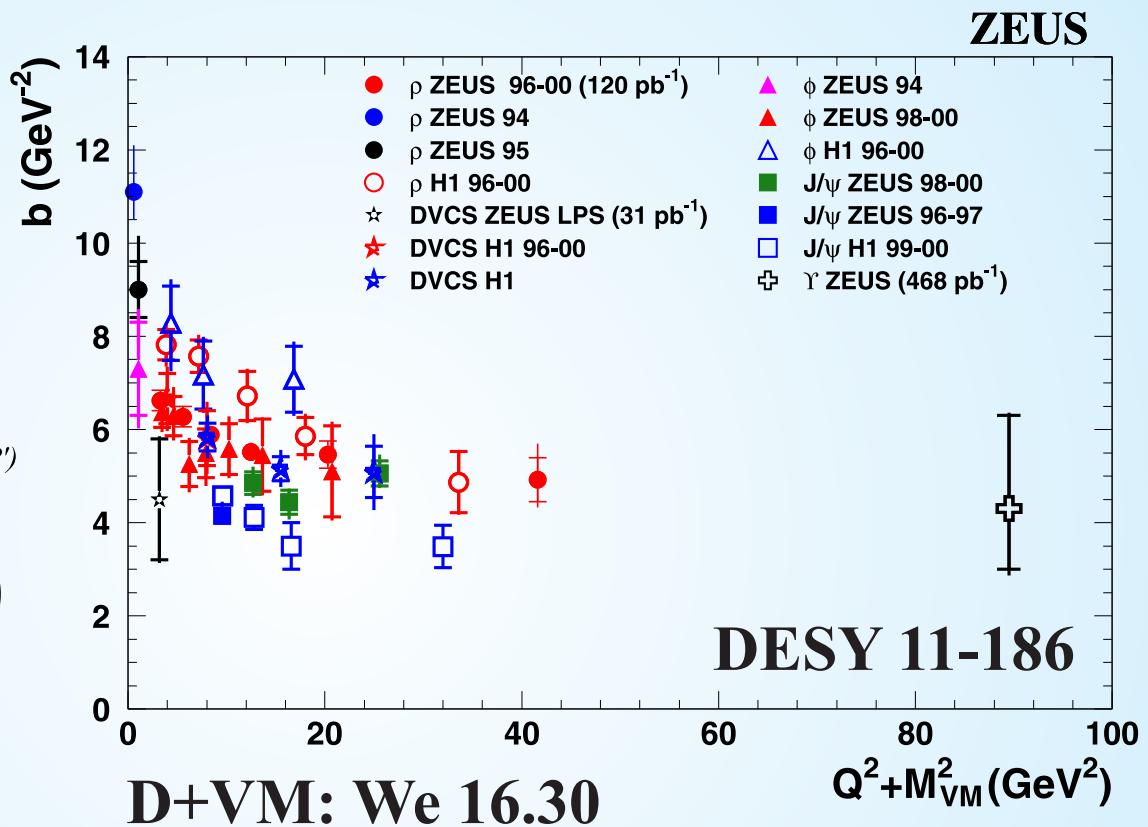

**transverse expansion of partons
-- in the proton?** D+VM: We 14.00

t-Slopes for Vector Meson Production

$$d\sigma/dt \sim \exp(-b|t|)$$

Should be analysed with respect to proton size.

More data: D+VM We 15.05, 15.25, 15.45

Proton Size and Dynamics

rms charge radius

electron: 0.8786 ± 0.0069 fm

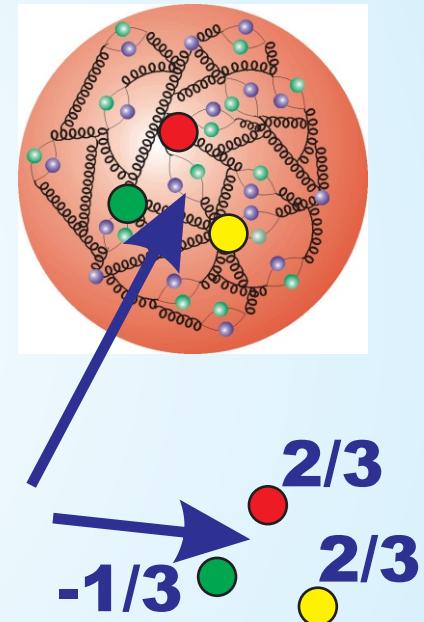

muon: 0.84184 ± 0.00067 fm

rms glue/sea radius

DVCS : 0.65 ± 0.02 fm

What a misleading picture....

dipole moment: $< 0.54 \cdot 10^{-23}$ ecm

Can we measure a dynamic system while averaging over time. Heisenberg again....

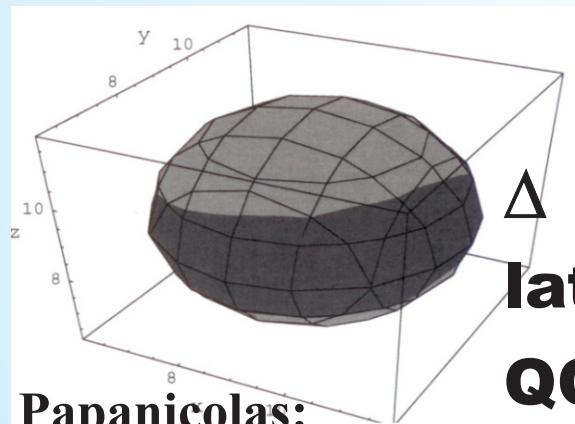

Proton Shape

magnetic moment

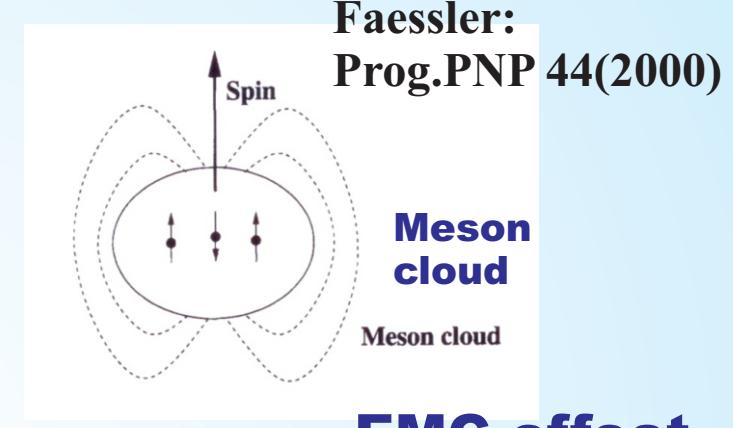

$$\mu_p/\mu_N = 2.792847356 \pm 0.000000023$$

$p \rightarrow \Delta$ excitations

[also used for GZK cutoff]

Papanicolas:
EPJ A 18(2003)

**There has to be some cloud,
otherwise they cannot interact.**

**Can we see the
proton behind the
strong field?**

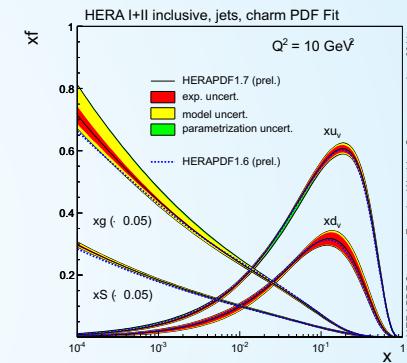

Summary

The proton still holds a lot of secrets.

Proton PDFs are getting measured with high precision, HERA was a success.

This allows for effective predictions and thus searches.

The interpretation of proton PDFs is not trivial.

There is more to the proton than PDFs.

There are many questions about size, shape and the spatial distribution of quarks and glue.

It might take more than pQCD to understand the proton.

Outlook

**HERA data will be used to the last bite.
LHC and new fixed target experiment
will join in and we will have perfect
PDFs.**

**Different communities will join and
we will have a 3d picture of the
valence, sea and glue structure of the proton.**

**We open the door
and look inside.
That is my vision.**
