

ZEUS measurement of the cross-section ratio $\sigma(\Psi(2S))/\sigma(J/\Psi)$ in deep inelastic exclusive ep scattering at HERA

Grzegorz Grzelak
on behalf of the ZEUS Collaboration

Faculty of Physics
University of Warsaw

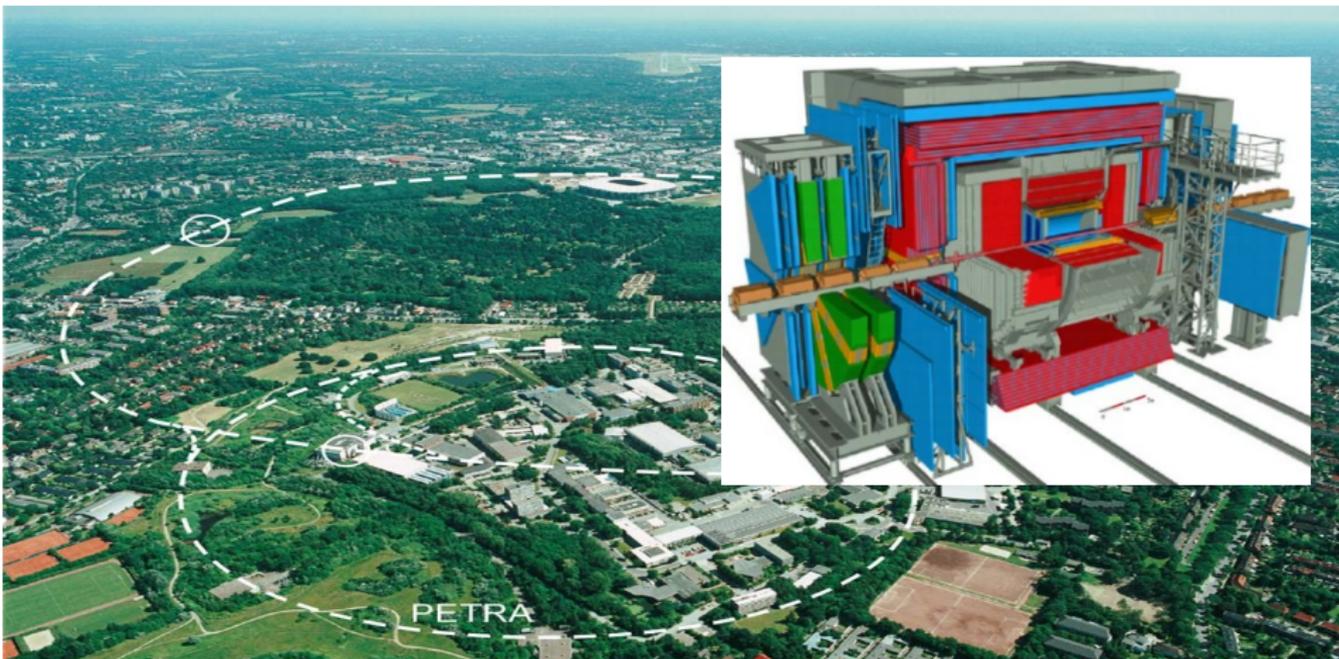

XXIII LOW-X MEETING
"Sarmata" Hotel, Sandomierz, Poland, 1-5 September 2015

- 1 Experimental apparatus: the HERA accelerator and the ZEUS detector
- 2 Introduction: Vector Meson Production in Exclusive Diffraction in ep Scattering
- 3 Analysis: Events selection and extraction of the signal
- 4 Results: Cross section ratio $\psi(2S)/J/\psi(1S)$ in DIS
- 5 Summary

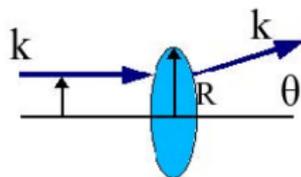

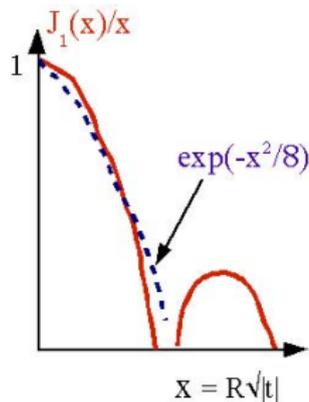

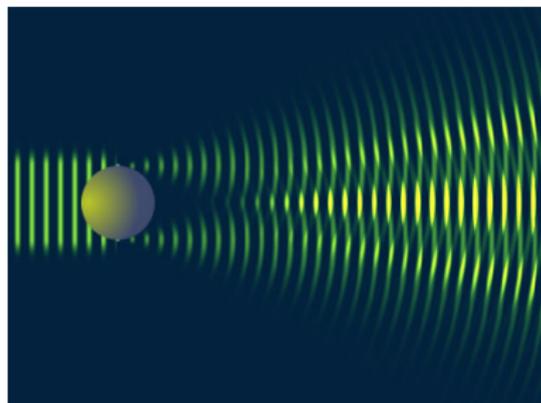

HERA and ZEUS: 1992 – 2007, DESY, Hamburg

HERA: world's first and only $e^\pm p$ collider, $E_e = 27.5 \text{ GeV}$, $E_p = 920 \text{ GeV}$ ($\sqrt{s} = 318 \text{ GeV}$)

ZEUS: multipurpose, hermetic detector

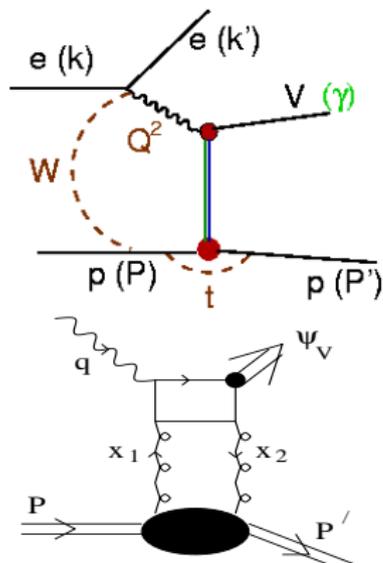

Total luminosity: $\int \mathcal{L} \sim 500 \text{ pb}^{-1}$ collected during HERA I + II running periods

Light Scattering in Fraunhofer approximation (wavelength $\lambda \sim 1/k \ll R$)

- $|t| = 4k^2 \sin^2(\theta/2)$
- $d\sigma/dt \sim e^{-b|t|}$ (first diffractive peak approximated from Bessel function)
- $b = (R/2)^2 \rightarrow$ transverse size of the target
- in the presented studies: **target \equiv proton** and **photon energy $\gg 1$ GeV**

Production of Vector Mesons in Exclusive Diffraction in ep Scattering

Exclusive process: proton stays intact
 Proton dissociation also possible \rightarrow
 background

pQCD: M_V^2 and Q^2 - set the scale at which the W and $|t|$ are probed

Kinematics: $M_V^2, Q^2, W, |t|$

M_V^2 - vector meson mass squared

$Q^2 (= -q^2 = -(k - k')^2)$ - the photon virtuality
 (emitted by the incoming electron):

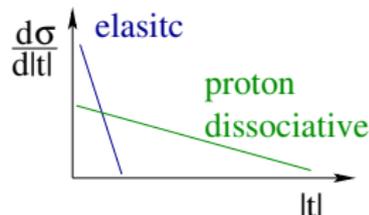

- $Q^2 \approx 0$ GeV² PHP (*Photoproduction*)
- larger Q^2 for DIS (*Deep Inelastic Scattering*)

$W = (q + P)^2$ - invariant mass of the γp system

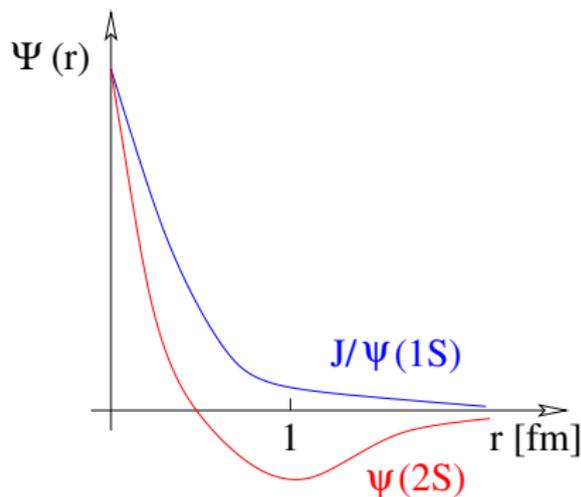

Process sensitive to the
gluon density in the proton

$|t|$ - 4-momentum transfer at the proton vertex

$t = (P - P')^2$

Cross section ratio $\psi(2S)/J/\psi(1S)$ in DIS

$$\text{Ratio } R = \frac{\sigma_{\gamma p \rightarrow \psi(2S)p}}{\sigma_{\gamma p \rightarrow J/\psi(1S)p}}$$

- sensitive to radial wave function of charmonium
- provides insight into the dynamics of the hard process

- $J/\psi(1S)$ and $\psi(2S)$ have distinctive wave functions
- $\psi(2S)$ has a node at ≈ 0.4 fm
- $\langle r_{\psi(2S)}^2 \rangle \approx 2 \langle r_{J/\psi(1S)}^2 \rangle$
- pQCD models predict $R \sim 0.17$ in PHP and moderate rise of R with Q^2 in DIS
- ψ' cross section is expected to be suppressed w.r.t. the J/ψ production

- Investigated decay channels:

- $\psi(2S) \rightarrow J/\psi + \pi^+\pi^-$, $\psi(2S) \rightarrow \mu^+\mu^-$, $J/\psi(1S) \rightarrow \mu^+\mu^-$

- HERA I+II DATA: $\mathcal{L} = 468 \text{ pb}^{-1}$ (1996 - 2007) with $5 < Q^2 < 80 \text{ GeV}^2$

- subsample of 114 pb^{-1} (HERA I) with $2 < Q^2 < 5 \text{ GeV}^2$

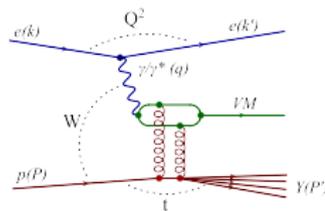

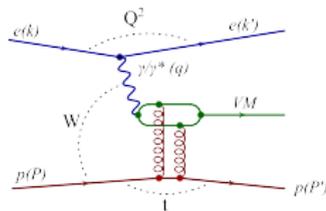

- MC Samples:

- Signal: **DIFFVM** for exclusive VM production (J/ψ and ψ')

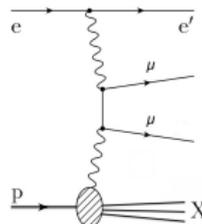

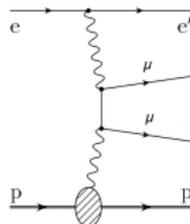

- $\frac{d\sigma}{dQ^2} \sim \frac{1}{(1+Q^2/M_V^2)^{1.5}}$

- $\frac{d\sigma}{d|t|} \sim \exp(-b|t|)$,

- $b = 4.0 \text{ GeV}^{-2}$

- Background: **GRAPE** for non resonant muon pair production (Bethe-Heitler process)

$$\psi(2S) \rightarrow \mu^+ \mu^- \pi^+ \pi^- \Rightarrow$$

Event selection:

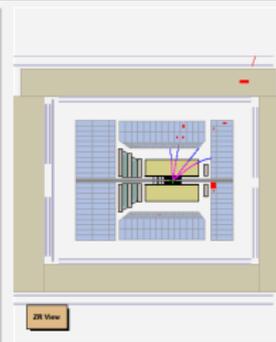

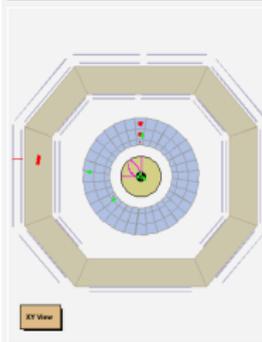

- scattered electron $E_{e'}$ > 10 GeV in CAL
- 2 (4 for $\psi(2S)$ 4-prongs decay) non-electron tracks from primary vertex, net charge = 0
- two tracks identified as muons (CAL, F/B/R/MUO, BAC)
- no other deposits not matched to tracks (above CAL noise)
 - proton remains undetected

Kinematic range:

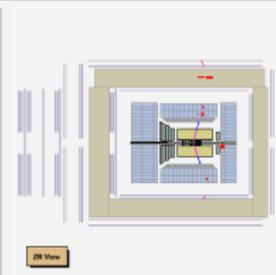

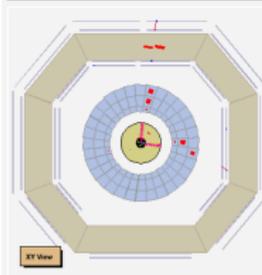

- (2) $5 \leq Q^2 \leq 80 \text{ GeV}^2$
- $30 \leq W \leq 210 \text{ GeV}$
- $|t| \leq 1 \text{ GeV}^2$

$$J/\psi(1S) \rightarrow \mu^+ \mu^- \Rightarrow$$

Selection specific for $\psi(2S) \rightarrow \mu^+ \mu^- \pi^+ \pi^-$ channel

- ΔM vs. $M_{\mu^+\mu^-}$
 $\Delta M = M(\mu^+\mu^-\pi^+\pi^-) - M(\mu^+\mu^-)$
cascade decay of $\psi(2S)$

- $0.5 < \Delta M < 0.7$ GeV
 $3.02 < M_{\mu^+\mu^-} < 3.17$ GeV

- $M(\mu^+\mu^-\pi^+\pi^-)$ after cleanup
very clean signature
 (≤ 3 background events at 90% CL)

Cross section ratio $R = \frac{\sigma(\psi(2S))}{\sigma(J/\psi(1S))}$ for full kinematic range

For $30 \leq W \leq 210$ GeV, $5 \leq Q^2 \leq 80$ GeV², $|t| \leq 1$ GeV²

$\psi(2S)$ decay mode	$R = \frac{\sigma(\psi(2S))}{\sigma(J/\psi(1S))}$
$\rightarrow J/\psi(\rightarrow \mu^+\mu^-)\pi^+\pi^-$	$0.29 \pm 0.04^{+0.02}_{-0.01}$
$\rightarrow \mu^+\mu^-$	$0.25 \pm 0.05^{+0.04}_{-0.02}$
combined	$0.28 \pm 0.03^{+0.02}_{-0.01}$

ZEUS Preliminary

- both channels provide consistent results

- $$R_{\psi(2S) \rightarrow J/\psi \pi^+ \pi^-} = \frac{\sigma_{\psi(2S)}}{\sigma_{J/\psi(1S)}} = \frac{N_{\psi(2S)}}{N_{J/\psi(1S)}} \cdot \frac{Acc_{J/\psi(1S) \rightarrow \mu^+ \mu^-}}{Acc_{\psi(2S) \rightarrow J/\psi \pi^+ \pi^-}} \cdot \frac{1}{BR_{\psi(2S) \rightarrow J/\psi \pi^+ \pi^-}}$$

- $$R_{\psi(2S) \rightarrow \mu^+ \mu^-} = \frac{\sigma_{\psi(2S)}}{\sigma_{J/\psi(1S)}} = \frac{N_{\psi(2S)}}{N_{J/\psi(1S)}} \cdot \frac{Acc_{J/\psi(1S) \rightarrow \mu^+ \mu^-}}{Acc_{\psi(2S) \rightarrow \mu^+ \mu^-}} \cdot \frac{BR_{J/\psi(1S) \rightarrow \mu^+ \mu^-}}{BR_{\psi(2S) \rightarrow \mu^+ \mu^-}}$$

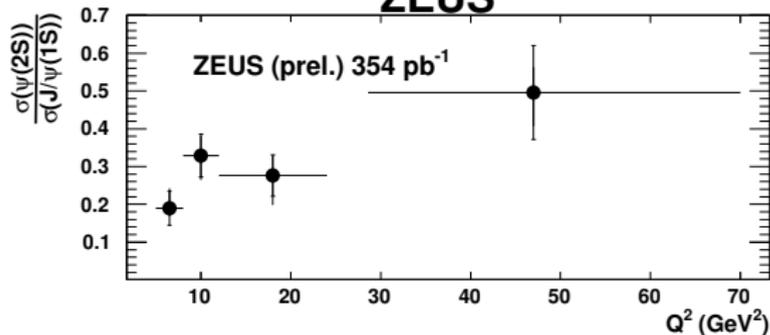

- $$Acc_i = \frac{N_i^{reco}}{N_i^{true}}$$

- $$BR(\psi(2S) \rightarrow J/\psi \pi^+ \pi^-) = (33.6 \pm 0.4)\%, BR(\psi(2S) \rightarrow \mu^+ \mu^-) = (7.7 \pm 0.8) \times 10^{-3},$$

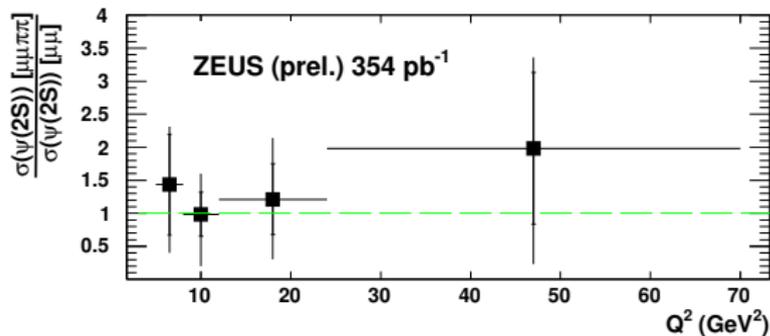

- $$BR(J/\psi \rightarrow \mu^+ \mu^-) = (5.93 \pm 0.06)\%$$

$$\text{Ratio } R = \frac{\sigma(\psi(2S))}{\sigma(J/\psi(1S))} \text{ vs. } Q^2$$

ZEUS

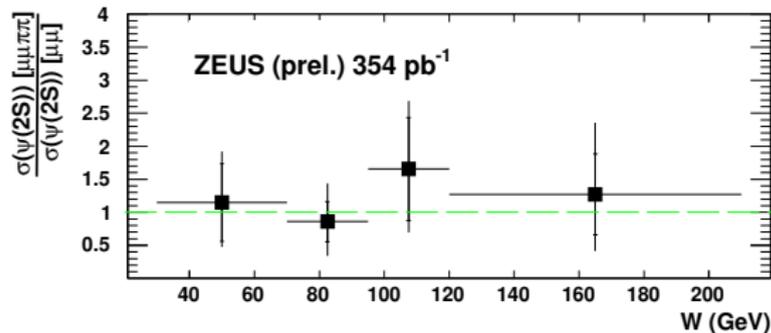

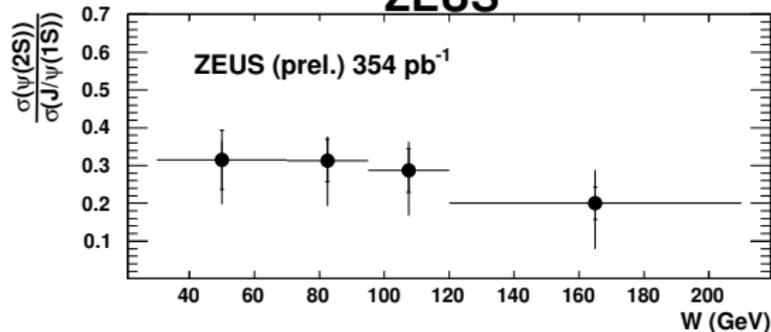

- R rises with Q^2

- $\frac{\sigma(\psi(2S) \rightarrow \mu^+ \mu^- \pi^+ \pi^-)}{\sigma(\psi(2S) \rightarrow \mu^+ \mu^-)}$

Ratio $R = \frac{\sigma(\psi(2S))}{\sigma(J/\psi(1S))}$ vs. W

ZEUS

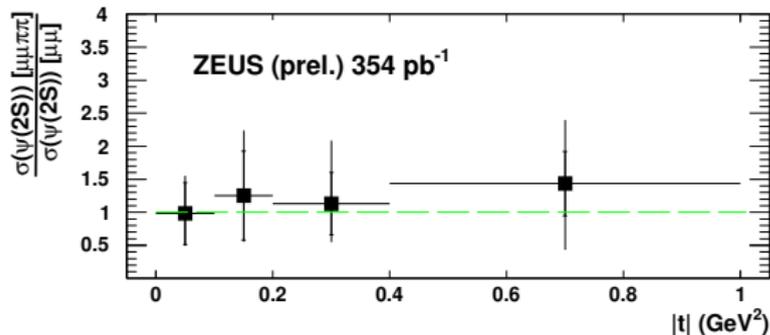

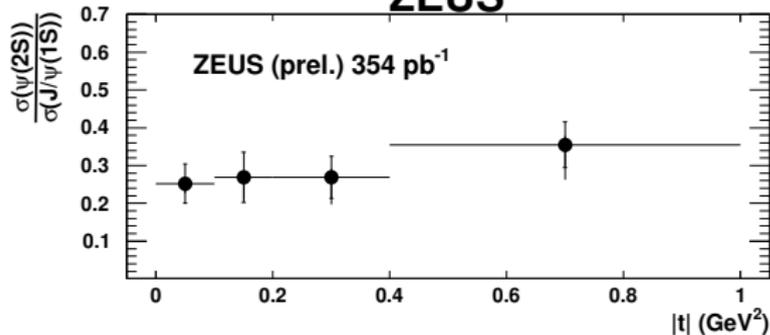

- R independent of W

- $\frac{\sigma(\psi(2S) \rightarrow \mu^+ \mu^- \pi^+ \pi^-)}{\sigma(\psi(2S) \rightarrow \mu^+ \mu^-)}$

$$\text{Ratio } R = \frac{\sigma(\psi(2S))}{\sigma(J/\psi(1S))} \text{ vs. } |t|$$

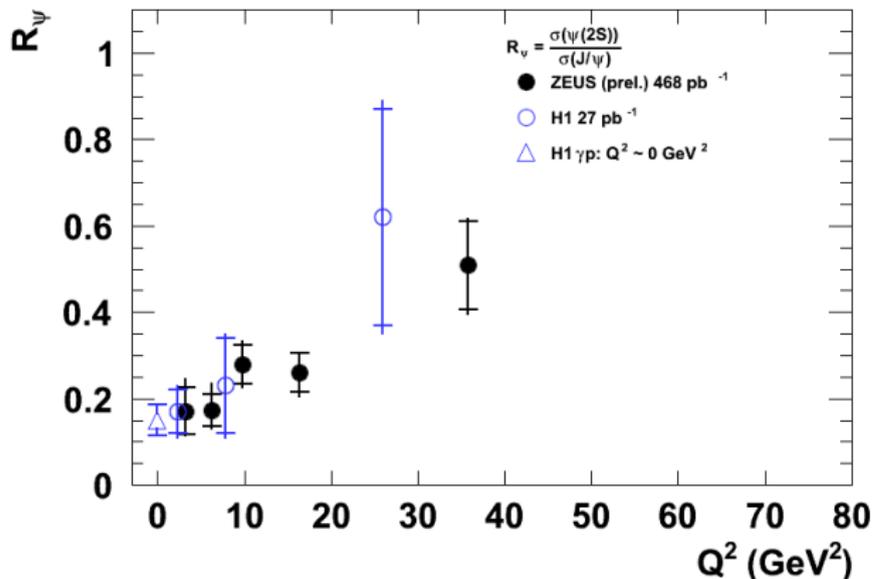

ZEUS

- R independent of $|t|$

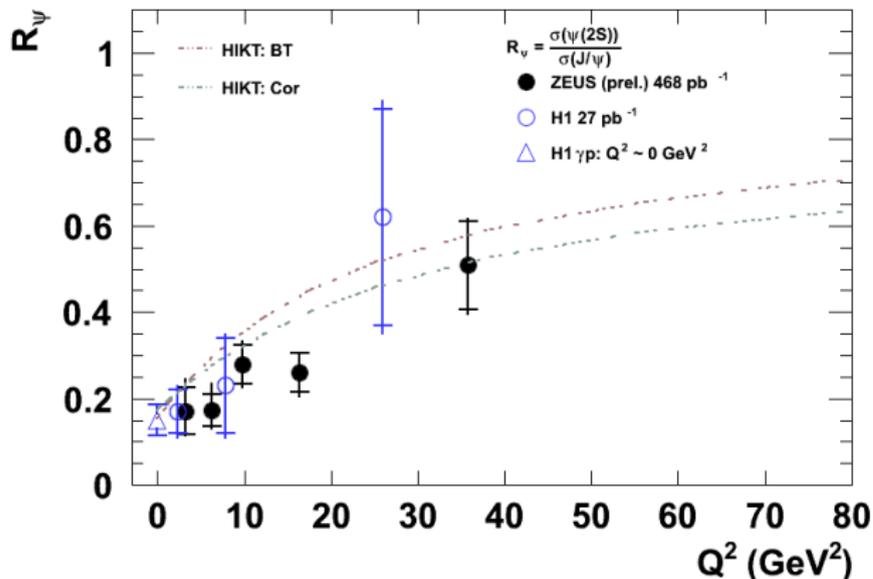

- $\frac{\sigma(\psi(2S) \rightarrow \mu^+ \mu^- \pi^+ \pi^-)}{\sigma(\psi(2S) \rightarrow \mu^+ \mu^-)}$

ZEUS

H1: EPJ **C10** 373 (1999)

- ZEUS: full HERA I + HERA II data sample (468 pb^{-1}) (incl. low- Q^2 point)
- both ZEUS and H1 measurements are in agreement: R increases with Q^2
- ZEUS improved accuracy due to the increased statistic of HERA I+II data

ZEUS

Phys. Rev. **D 62** 094022 (2000)

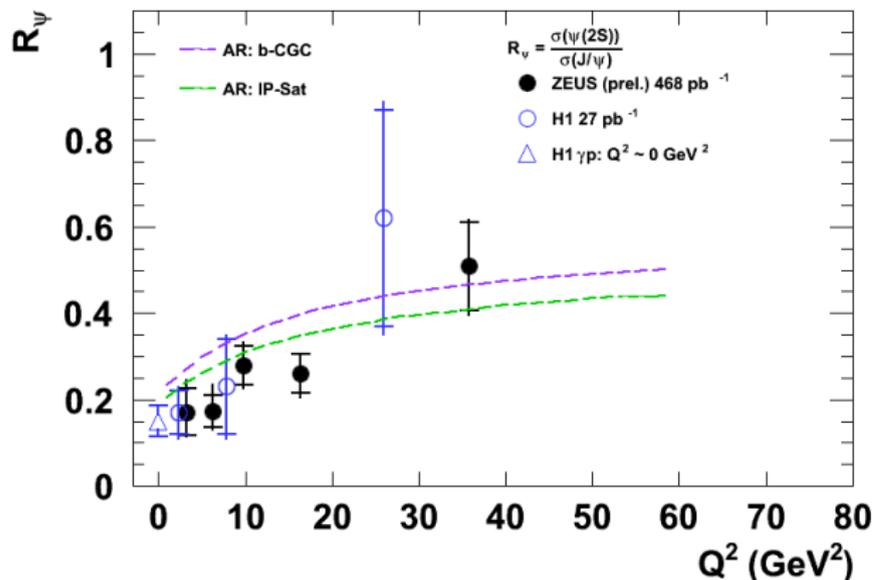

Phys. Rev. **D 59** 14017 (1999)

Phys. Rev. **D 62** 054022 (2000)

$$V(r) \sim -\frac{k}{r} + \frac{r}{a^2}$$

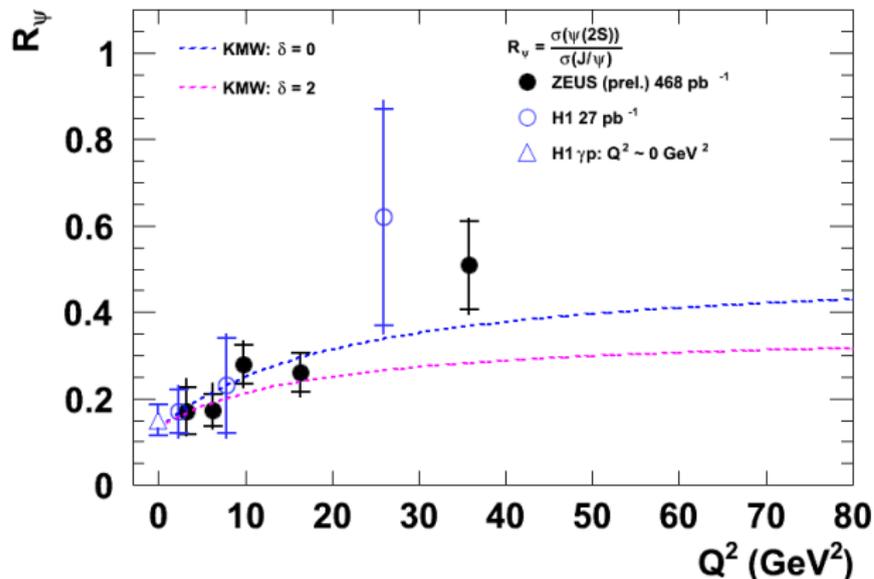

- HIKT: Hüfner et al. → adopt the light-cone dipole formalism to describe VM production, the dipole - proton interaction cross section is constrained by inclusive low-x DIS data from HERA (BT and Cor: different charmonium potentials with $m_c \approx 1.5$ GeV)
- HIKT - BT: overestimates lower Q^2 points

ZEUS

Phys. Rev. D **90** 054003 (2014)

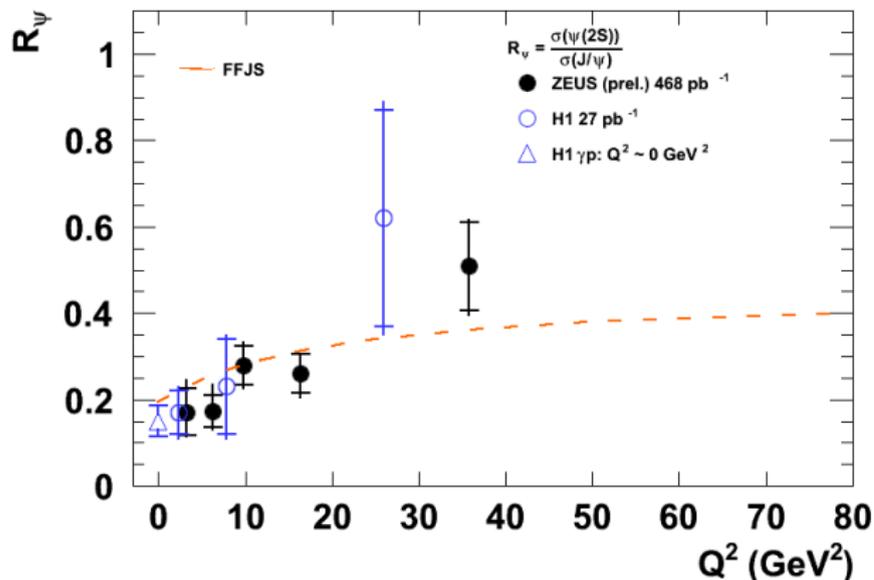

- AR: Armesto and Rezaeian → two predictions are presented: results from the Impact-Parameter dependent Color Glass Condensate (b-CGC) and the gluon Saturation (IP-Sat) dipole models
- b-CGC overestimates lower Q^2 points

ZEUS

Phys. Rev. D **74** 074016 (2006)

- KMW: Kowalski, Motyka, Watt → impact parameter dependent saturated dipole model, based on the QCD description and an assumption of universality of the gluon distribution and proton shape: $\delta = 0$ non-relativistic wave functions, $\delta = 2$ relativistic boosted Gaussian model

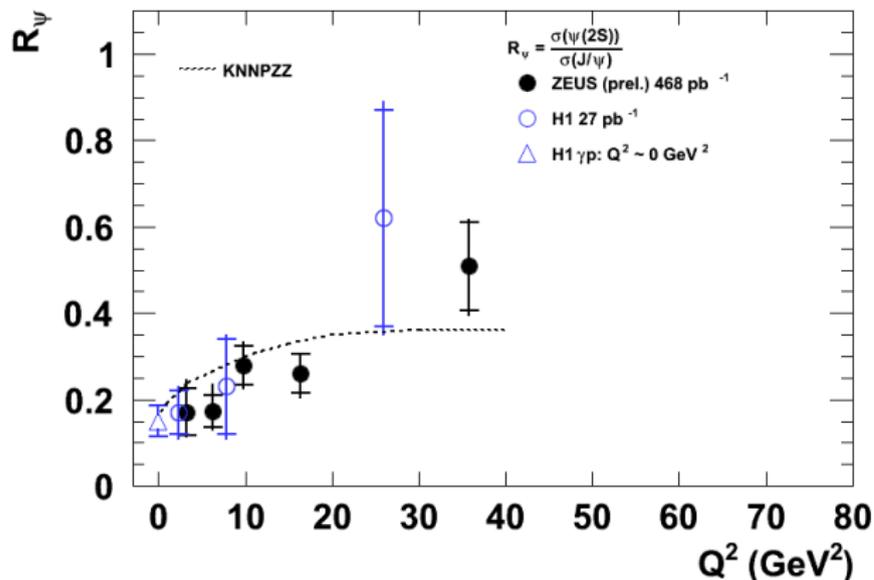

ZEUS

Phys. Rev. D **90** 016007 (2014)

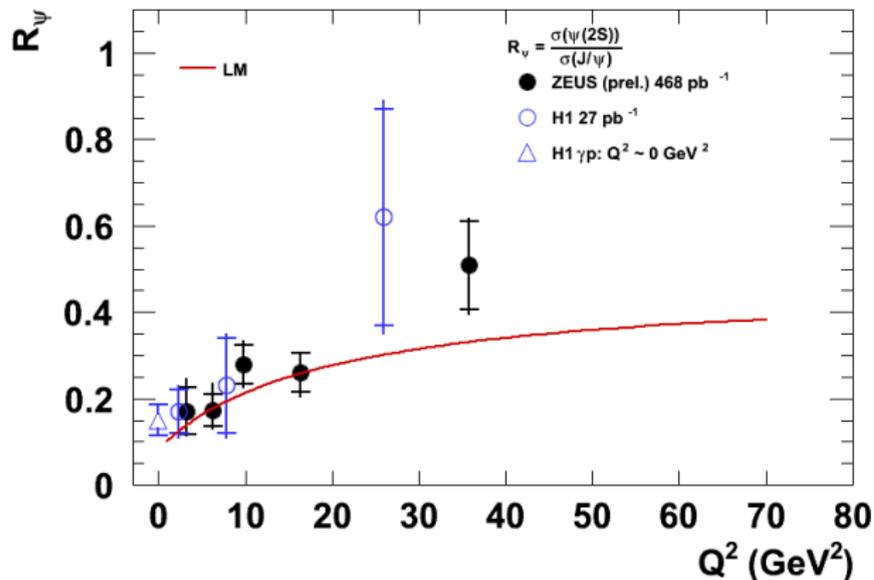

- FFJS: Fazio et al. → two component Pomeron model to predict the cross sections for Vector Meson production. The Pomeron is universal, containing two terms, a “soft” and a “hard” one: relative weights: $\sim \tilde{Q}^2 = Q^2 + M_V^2$.

ZEUS

Phys. Lett. **B 342** 228 (1994)

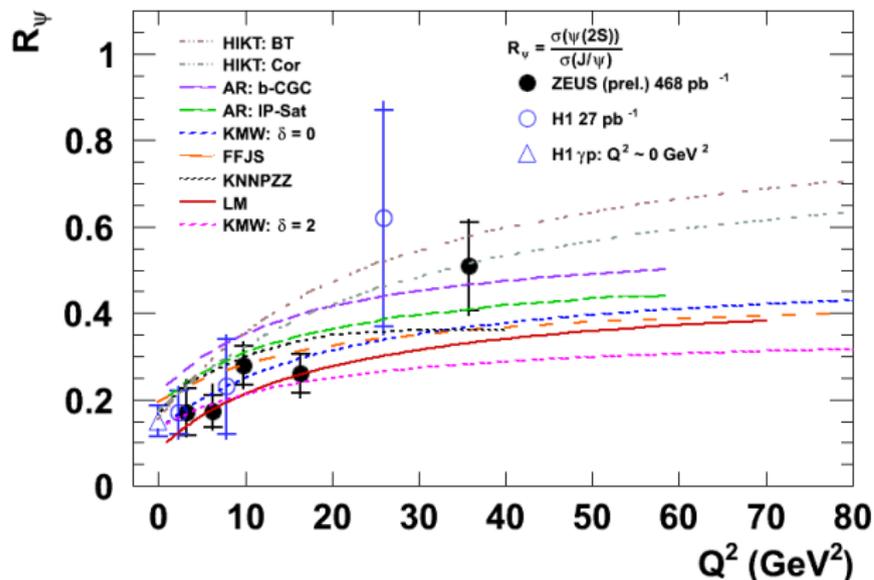

- KNNPZZ: Nemchik et al. → describe the BFKL Pomeron in terms of the colour-dipole cross section which is a solution of the generalized BFKL equations

ZEUS

Phys. Rev. C **83** 065202 (2011)

- LM: Lappi and Mäntysaari → use the BFKL evolution as well as the dipole picture in the IP-Sat model to predict VM production

ZEUS

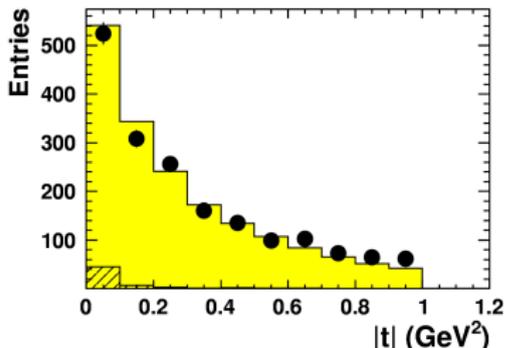

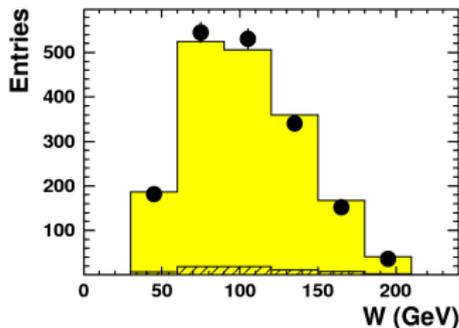

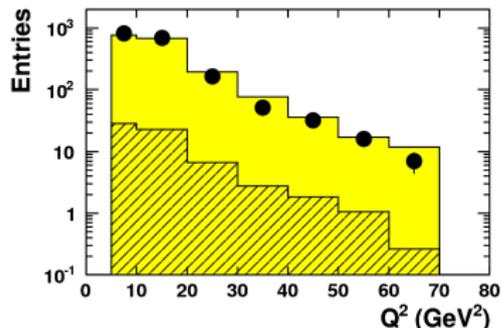

- All models predict the rise of $\sigma(\psi(2S))/\sigma(J/\psi)$ with Q^2 , many theoretical predictions are consistent with data within current precision, but...
- ...data begin to discriminate some models

- **Ratio of $\frac{\sigma(\psi(2S))}{\sigma(J/\psi(1S))}$** using HERA I+II data was measured for the first time by ZEUS in the kinematic range: $30 \leq W \leq 210$ GeV, $2 \leq Q^2 \leq 80$ GeV², $|t| \leq 1$ GeV² for exclusive DIS
- The accuracy has been improved compared to the H1 HERA I results
- The ratio increases with Q^2 and is constant as a function of W and $|t|$
- Theoretical calculations of the ratio $\frac{\sigma(\psi(2S))}{\sigma(J/\psi(1S))}$ for exclusive vector-meson production has been compared to the experimental data
→ majority of the predictions are consistent with the data
- **data start to exhibit constraining power**

ZEUS to H1 comparison (in H1 phase space and H1 bins)

- cross check: ZEUS data analyzed in Q^2 bins used by H1: [EPJ **C10** (1999) 373.]
(5 – 12) GeV^2 and (12 – 80) GeV^2
- $40 < W < 180$ GeV and $1 < Q^2 < 80$ GeV^2

- both measurements are in agreement
- improved accuracy due to the increased statistic of HERA II data

Systematics checks (2-prongs and 4-prongs channels)

- varying the $M_{\mu\mu}$ window for signal event counting:
 - for $J/\psi(1S)$: from 3.02 – 3.17 GeV to 3.05 – 3.15 GeV and 2.97 – 3.19 GeV
 - for $\psi(2S)$: from 3.59 – 3.79 GeV to 3.62 – 3.75 GeV and 3.55 – 3.80 GeVchanges the values of $R_{\mu\mu}$ by 5% and $R_{J/\psi\pi\pi}$ by 2%
- varying the cut on pions transverse momenta p_T from 0.12 GeV to 0.15 GeV changes the $R_{J/\psi\pi\pi}$ by 4.5%
- changing the background fit function from linear to quadratic changes the values of $R_{\mu\mu}$ by 12% and $R_{J/\psi\pi\pi}$ by 0.5%
- changing the reconstruction of kinematic variables from “constrained” to “electron” method changes the values of $R_{\mu\mu}$ and $R_{J/\psi\pi\pi}$ by 1.5%
- not reweighting the MC samples changes the values of $R_{\mu\mu}$ by 3.5% and $R_{J/\psi\pi\pi}$ by 1%
- applying more restrictive cuts on the number of (soft/noisy) tracks not associated with the event vertex changes the values of $R_{\mu\mu}$ by 5% and $R_{J/\psi\pi\pi}$ by 3%

Total systematic uncertainties are: $\delta R_{\mu\mu} = {}^{+7}_{-14}\%$, $\delta R_{J/\psi\pi\pi} = {}^{+4}_{-5}\%$ and $\delta R = {}^{+3}_{-5}\%$
