Deep inelastic scattering

- ▶ Inclusive deep inelastic scattering (DIS) measurements in lepton-hadron collisions ($ep \rightarrow eX$) are essential to determine the parton distribution functions (PDFs) of the proton (xf). At leading order:

$$\frac{d^2\sigma_{\text{NC DIS}}^{\pm}}{dx_{\text{Bj}}dQ^2} = \frac{2\pi\alpha^2}{x_{\text{Bj}}Q^4} \left(\underbrace{Y_+ F_2(x_{\text{Bj}}, Q^2)}_{\sim xq+x\bar{q}} \mp \underbrace{Y_- x_{\text{Bj}} F_3(x_{\text{Bj}}, Q^2)}_{\sim xq-x\bar{q}} - \underbrace{y^2 F_L(x_{\text{Bj}}, Q^2)}_{\sim xg \times \alpha_s} \right)$$

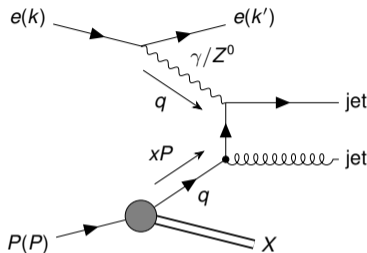

⇒ By measuring F_2 and F_3 , the quark- and antiquark-distributions, xq and $x\bar{q}$, can be probed

- ▶ By measuring F_L or using scaling violations in DGLAP equations the product of the gluon distribution xg and the strong coupling constant α_s can be determined
- ▶ Using higher order terms, the two can be disentangled to some extent, but a strong correlation remains

Jet measurements

- ▶ Already at leading order,[†] jet production in DIS is sensitive to the strong coupling independently of the gluon distribution (upper graph)
- ▶ Additionally, jet production can also be used to further constrain the gluon distribution (lower graph)
- ▶ Inclusive jet measurements are especially well suited for precision determinations of the strong coupling constant due to their small uncertainties on both the experimental and theoretical side

[†] Leading order in the Breit frame; see slide 5

Deep inelastic scattering

- ▶ Scattering of leptons off hadrons at high momentum transfer Q^2

$$e(k) + P(P) \rightarrow e(k') + p'(p') + X$$

- ▶ Boson acts as point-like probe of the hadron

Kinematic quantities

$$Q^2 = -q^2 = -(k' - k)^2$$

$$x_{\text{Bj}} = \frac{Q^2}{2P \cdot q}$$

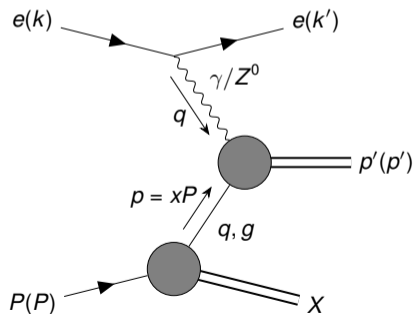

$$y = \frac{P \cdot q}{P \cdot k}$$

Boson virtuality/

parameter

Inelasticity

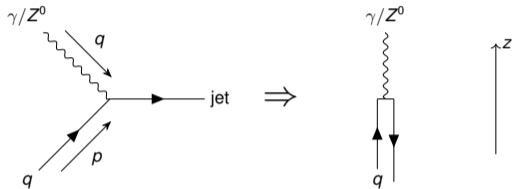

p' ... Scattered hadronic system
 X ... Proton remnant

- ▶ To predict cross sections of lepton-hadron collisions, one needs
 - ▶ The boson-parton cross sections $\hat{\sigma}$ (calculable using perturbative QCD)
 - ▶ The parton content of the hadron (unknown but assumed to be universal for each hadron); parameterised using PDFs xf
- ▶ PDFs can only be determined from fits to measurements
- ▶ Adding jet data to the fit allows a simultaneous determination of α_s and the PDFs

- ▶ Single jets may arise purely from QED, which is uninteresting for studies of QCD
- ▶ To suppress these events: require minimum transverse momentum in Breit frame

In the **Breit frame**, the
parton and photon
collide head-on

$$q^\mu = \begin{pmatrix} 0 \\ 0 \\ 0 \\ -Q \end{pmatrix}$$

$$p^\mu = \begin{pmatrix} Q/2 \\ 0 \\ 0 \\ Q/2 \end{pmatrix}$$

- ▶ Single jets may arise purely from QED, which is uninteresting for studies of QCD
- ▶ To suppress these events: require minimum transverse momentum in Breit frame

In the **Breit frame**, the parton and photon collide head-on

$$q^\mu = \begin{pmatrix} 0 \\ 0 \\ 0 \\ -Q \end{pmatrix}$$

$$p^\mu = \begin{pmatrix} Q/2 \\ 0 \\ 0 \\ Q/2 \end{pmatrix}$$

- ▶ Lowest order process: produce two jets of equal transverse momentum (“dijet”)
- ▶ Inclusive jets: count each jet individually; events can contribute multiple times

Summary

HERA accelerator

- ▶ Only lepton-hadron collider so far
- ▶ Located at DESY in Hamburg, Germany
- ▶ Two run periods:
 - ▶ HERA 1: 1992 – 2000
 - ▶ HERA 2: 2003 – 2007
- ▶ Circular collider of length 6336 m
- ▶ Collide electrons/positrons at 27.5 GeV with protons at 920 GeV $\rightarrow \sqrt{s} = 318$ GeV

ZEUS detector

- ▶ General purpose particle detector
- ▶ Integrated luminosity during HERA 2: 347 pb^{-1}
- ▶ High-resolution uranium-scintillator calorimeter allows precise measurement of jet energies

Cross sections
QCD analysis
Summary

- ▶ Inclusive jets (count each jet individually, rather than each event)
- ▶ Jets clustered using k_{\perp} algorithm and p_{\perp} -weighted scheme (massless jets) in Breit frame
- ▶ Phase space

$150 \text{ GeV}^2 <$	$Q^2 <$	$15\,000 \text{ GeV}^2$
$0.2 <$	$y <$	0.7
$7 \text{ GeV} <$	$p_{\perp, \text{Breit}} <$	50 GeV
$-1 <$	$\eta_{\text{lab}} <$	2.5
- ▶ Hadron level jets
- ▶ Exchange of Z^0 boson included
- ▶ QED Born level (higher order effects removed)

NNLO predictions
Cross sections
QCD analysis
Summary

ZEUS preliminary

- ▶ Reconstructed jets corrected to hadron level using bin-by-bin correction factors obtained from Monte Carlo samples
 - ▶ ARIADNE: colour dipole model
 - ▶ LEPTO: leading $\log(Q^2)$ parton cascade
- ▶ After reweighting, the models give a good description of the data across the entire phase space

Theoretical predictions

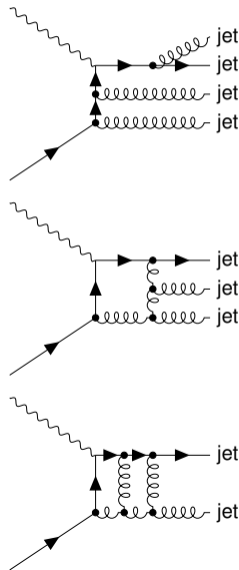

- ▶ Cross section predictions are calculated at NNLO accuracy
- ▶ Matrix elements calculated using NNLOJET[†]
- ▶ PDFs taken from HERAPDF2.0Jets NNLO[‡]
- ▶ $\alpha_s(M_Z^2) = 0.1155$, $\mu_r^2 = \mu_f^2 = Q^2 + p_{\perp}^2$
- ▶ Predictions corrected for hadronisation and Z^0 -exchange

Theoretical uncertainties

- ▶ Six point scale variation by factor 2
- ▶ Statistical uncertainty of matrix element generation
- ▶ Hadronisation correction uncertainty
- ▶ PDF uncertainty (fit, model, parameterisation)

Experiment
Analysis
Cross sections
QCD analysis
Summary

ZEUS preliminary

- ▶ Measured cross sections[†] are compatible with previous measurement from H1 collaboration[‡] and uncertainties are comparable[§]
- ▶ Measurements are compatible with NNLO QCD predictions and show similar trends relative to the theory
- ▶ Uncertainty mostly dominated by jet energy scale; at high Q^2 or high $p_{\perp, \text{Breit}}$ statistical uncertainty becomes dominant

[†] ZEUS-prel-22-001 (2022)

[‡] EPJC 75, 65 (2015). arXiv:1406.4709

[§] Statistical uncertainties of the H1 measurement appear large, due to negative correlations between the data points, which are not shown

- ▶ Simultaneous fit of PDF parameters and $\alpha_s(M_Z^2)$ at NNLO accuracy

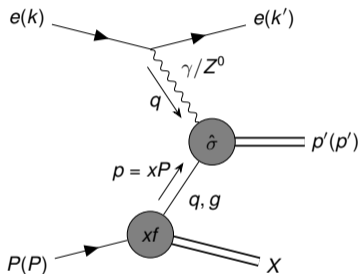

- ▶ Datasets used

- ▶ H1+ZEUS combined inclusive DIS
- ▶ ZEUS HERA 1 inclusive jets at high Q^2
- ▶ ZEUS HERA 1+2 dijets at high Q^2
- ▶ **ZEUS HERA 2 inclusive jets at high Q^2**

- ▶ Inclusion of additional jet data is expected to reduce uncertainty of $\alpha_s(M_Z^2)$
- ▶ Statistical correlations between ZEUS HERA 2 jet datasets taken into account via correlation matrix
- ▶ Use HERAPDF parameterisation of PDFs ($f = g, u_v, d_v, \bar{U}, \bar{D}$)

$$xf(x) = A_f x^{B_f} (1-x)^{C_f} (1 + D_f x + E_f x^2)$$

- ▶ Use settings similar to HERAPDF2.0Jets NNLO (central scales, cuts, model parameters, treatment of hadronisation and theory grid uncertainty)

For reference, HERAPDF2.0Jets NNLO found

$$\alpha_s(M_Z^2) = 0.1156 \pm 0.0011 \text{ (exp/fit)} \begin{matrix} +0.0001 \\ -0.0002 \end{matrix} \text{ (model/parameterisation)} \pm 0.0029 \text{ (scale)}$$

This analysis

$$\alpha_s(M_Z^2) = 0.1138 \pm 0.0014 \text{ (exp/fit)} \begin{matrix} +0.0004 \\ -0.0008 \end{matrix} \text{ (model/parameterisation)} \begin{matrix} +0.0012 \\ -0.0005 \end{matrix} \text{ (scale)}$$

- ▶ Central value is compatible with HERAPDF and with PDG world average
- ▶ Increased experimental uncertainty, due to fewer jet datasets used
- ▶ Significantly decreased scale uncertainty, due to absence of low Q^2 jet data
 - ▶ Scale uncertainty of the cross sections is assumed as fully correlated between all jet points and datasets, which is reasonable for neighbouring points in phase space
 - ▶ When fitting points far away from each other in phase space or in different final states, the scale uncertainty might be much less correlated or even anti-correlated
 - ▶ Fully correlated treatment across entire phase space might give a larger uncertainty

For reference, HERAPDF2.0Jets NNLO found

$$\alpha_s(M_Z^2) = 0.1156 \pm \mathbf{0.0011} \text{ (exp/fit)}_{-0.0002}^{+0.0001} \text{ (model/parameterisation)} \pm 0.0029 \text{ (scale)}$$

This analysis

$$\alpha_s(M_Z^2) = 0.1138 \pm \mathbf{0.0014} \text{ (exp/fit)}_{-0.0008}^{+0.0004} \text{ (model/parameterisation)}_{-0.0005}^{+0.0012} \text{ (scale)}$$

- ▶ Central value is compatible with HERAPDF and with PDG world average
- ▶ Increased experimental uncertainty, due to fewer jet datasets used
- ▶ Significantly decreased scale uncertainty, due to absence of low Q^2 jet data
 - ▶ Scale uncertainty of the cross sections is assumed as fully correlated between all jet points and datasets, which is reasonable for neighbouring points in phase space
 - ▶ When fitting points far away from each other in phase space or in different final states, the scale uncertainty might be much less correlated or even anti-correlated
 - ▶ Fully correlated treatment across entire phase space might give a larger uncertainty

For reference, HERAPDF2.0Jets NNLO found

$$\alpha_s(M_Z^2) = 0.1156 \pm 0.0011 \text{ (exp/fit)} \begin{matrix} +0.0001 \\ -0.0002 \end{matrix} \text{ (model/parameterisation)} \pm \mathbf{0.0029 \text{ (scale)}}$$

This analysis

$$\alpha_s(M_Z^2) = 0.1138 \pm 0.0014 \text{ (exp/fit)} \begin{matrix} +0.0004 \\ -0.0008 \end{matrix} \text{ (model/parameterisation)} \begin{matrix} +0.0012 \\ -0.0005 \end{matrix} \text{ (scale)}$$

- ▶ Central value is compatible with HERAPDF and with PDG world average
- ▶ Increased experimental uncertainty, due to fewer jet datasets used
- ▶ Significantly decreased scale uncertainty, due to absence of low Q^2 jet data
 - ▶ Scale uncertainty of the cross sections is assumed as fully correlated between all jet points and datasets, which is reasonable for neighbouring points in phase space
 - ▶ When fitting points far away from each other in phase space or in different final states, the scale uncertainty might be much less correlated or even anti-correlated
 - ▶ Fully correlated treatment across entire phase space might give a larger uncertainty

- ▶ To further mitigate this problem, an alternative treatment of the scale uncertainty as half correlated/half uncorrelated between all points and datasets was investigated

- ▶ Due to absence of low Q^2 jet data in fit, additional reduction is moderate

$$\begin{array}{ccc} +0.0012 & \rightarrow & +0.0008 \\ -0.0005 & & -0.0007 \end{array}$$

- ▶ When fitting data across a wider range in phase space, the alternative approach is expected to make a more significant impact
- ▶ Reduced scale uncertainty means that the present analysis is one of the most precise measurements of $\alpha_s(M_Z^2)$ at hadron colliders so far[†]

Strategy
Results
Summary

ZEUS preliminary

- ▶ Compare measurement to two sets of calculated cross sections:
 - 1 Using on PDFs and α_s from fit presented on previous slides (green line)
 - 2 Using similar fit, but excluding the new jet dataset (dashed blue line)
- ▶ Including the new dataset improves the agreement between calculation and data very slightly, indicating that the new cross sections are consistent with previous jet datasets from ZEUS
- ▶ Changes are due to updated value of α_s and the gluon PDF; quark distributions are not significantly affected by additional jet dataset

Cross section measurement

- ▶ Inclusive jet cross sections have been measured using ZEUS data during HERA 2
- ▶ Cross sections are compatible with the corresponding H1 measurement and NNLO theory
- ▶ Uncertainties comparable with the corresponding H1 measurement

QCD analysis

- ▶ New dataset is ideal ingredient for precision determinations of $\alpha_s(M_Z^2)$ in future QCD fits
- ▶ A very competitive measurement of $\alpha_s(M_Z^2)$ has been achieved due to
 - ▶ Restriction to high Q^2 jet data in the fit
 - ▶ To a lesser extent: alternative treatment of scale uncertainty
